# Bottom-up rewriting for words and terms

## I. Durand and G. Sénizergues

LaBRI, Bordeaux 1 university, 351 cours de la libération, 33405, Talence, Cedex, France

#### Abstract

For the whole class of linear term rewriting systems, we define *bottom-up* rewriting which is a restriction of the usual notion of rewriting. We show that bottom-up rewriting effectively inverse-preserves recognizability and analyze the complexity of the underlying construction.

The Bottom-Up class (BU) is, by definition, the set of linear systems for which every derivation can be replaced by a bottom-up derivation. Membership to BU turns out to be undecidable, we are thus lead to define more restricted classes: the classes  $\mathsf{SBU}(k), k \in \mathbb{N}$  of  $Strongly\ Bottom\text{-}Up(k)$  systems for which we show that membership is decidable. We define the class of  $Strongly\ Bottom\text{-}Up$  systems by  $\mathsf{SBU} = \bigcup_{k \in \mathbb{N}} \mathsf{SBU}(k)$ . We give a polynomial sufficient condition for a system to be in  $\mathsf{SBU}$ . The class  $\mathsf{SBU}$  contains (strictly) several classes of systems which were already known to inverse preserve recognizability: the inverse left-basic semi-Thue systems (viewed as unary term rewriting systems), the linear growing term rewriting systems, the inverse Linear-Finite-Path-Ordering systems.

Keywords: Term rewriting systems; Semi-Thue systems;

Regularity preservation; Accessibility problem.

2000 MSC: 68Q42, 03D03, 03D40

#### 1. Introduction

General framework. An important concept in rewriting is the notion of preservation of recognizability through rewriting. Each identification of a more general class of systems preserving recognizability, yields almost directly a

Email address: {idurand,ges}@labri.fr (I. Durand and G. Sénizergues)

new decidable call-by-need [12] class, decidability results for confluence, accessibility, joinability. Also, recently, this notion has been used to prove termination of systems for which none of the already known termination techniques work [18]. Such a preservation property is also a tool for studying the recognizable/rational subsets of various monoids which are defined by a presentation  $\langle X, \mathcal{R} \rangle$ , where X is a finite alphabet and  $\mathcal{R}$  a Thue system (see for example [25, 26]). Consequently, the seek of new decidable classes of systems which preserve (or inverse preserve) recognizability is worthwile.

Many such classes defined so far have been defined by imposing syntactical restrictions on the rewrite rules. For instance, in *growing* systems ([21, 27]) variables at depth strictly greater than 1 in the left-handside of a rule cannot appear in the corresponding right-handside. Finite-path Overlapping systems [35] are also defined by syntactic restrictions on the system. The class of Finite-path Overlapping systems contains the class of growing systems [27]. Previous works on semi-Thue systems also prove recognizability preservation, under syntactic restrictions: cancellation systems [2], monadic systems [4], basic systems [1], and left-basic systems [30] (see [32] for a survey).

Other works establish that some *strategies* i.e. restrictions on the derivations rather than on the rules, ensure preservation of recognizability. Various such strategies were studied in [16], [29], [33].

We rather follow here this second approach: we define a new rewriting strategy which we call bottom-up rewriting for linear term rewriting systems. The bottom-up derivations are, intuitively, those derivations in which the rules are applied, roughly speaking, from the bottom of the term towards the top (this set of derivations contains strictly the bottom-up derivations of [29] and the one-pass leaf-started derivations of [16]). An important feature of this strategy, as opposed to the ones quoted above, is that it allows overlaps between successive applications of rules. A class of systems is naturally associated with this strategy: it consists of the systems  $\mathcal{R}$  for which the binary relation  $\to_{\mathcal{R}}^*$  coincides with its restriction to the bottom-up strategy. We call "bottom-up" such systems and denote by BU the set of all bottom-up systems.

Overview of the paper. Most of the results proved in this paper were announced in [13], which can thus be considered as a medium-scale overview of this paper. Let us give here a large-scale overview, section by section, of the contents of the paper.

In section 2, we have gathered all the necessary recalls and notation about words, terms, rewriting and automata.

In Section 3, we define bottom-up rewriting for linear term rewriting systems using marking techniques. We first define bottom-up(k) derivations for  $k \in \mathbb{N}$  (bu(k) derivations for short) and the classes Bottom-up(k) (BU(k) for short) of linear systems which consists of those systems which admit bu(k) rewriting, i.e. such that every derivation between two terms can be replaced by a bu(k) derivation, and the Bottom-up class (BU) of bottom-up systems which is the infinite union of the BU(k) (for k varying in  $\mathbb{N}$ ).

In Section 4, we prove Theorem 4.2 which is the main result of the paper: bottom-up rewriting inverse-preserves recognizability. Our proof consists of a reduction to the preservation of recognizability by finite ground systems, shown in [6],[10]. The proof is constructive *i.e* gives an algorithm for computing an automaton recognizing the antecedents of a recognizable set of terms. We estimate the complexity of the algorithm: a separate tight upper-bound is given for  $BU^-(1)$  semi-Thue systems; another upper-bound is given for  $BU^-(1)$  term rewriting systems; finally, a general upper-bound is given for  $BU^-(k)$  term rewriting systems. We then give a lower bound for  $BU^-(1)$  term rewriting systems showing that some of our upper-bounds cannot be easily improved.

In Section 5, we show that BU contains all the classes of semi-Thue systems quoted above (once translated into term rewriting systems in which all symbols have arity 0 or 1), and also the linear growing systems of [21]. We study the decidability of membership to the BU(k) classes. We show that membership to BU(k) is undecidable for  $k \ge 1$  even for semi-Thue systems.

In Section 6, we define the restricted class of  $strongly\ bottom-up(k)$  systems (SBU(k)) for which we show decidable membership. We define the class of  $strongly\ bottom-up$  systems SBU =  $\bigcup_{k\in\mathbb{N}}$  SBU(k). Based on the results of [23], it seems likely that the property [ $\exists k\geq 0$  such that  $\mathcal{R}\in \mathsf{SBU}(k)$ ] (so membership to SBU) is undecidable. We give a polynomial sufficient condition for a system to be in SBU. We finally show that  $\mathsf{LFPO}^{-1}\subsetneq \mathsf{SBU}$ .

# 2. Preliminaries

This section is mostly devoted to recalling some classical notions and making precise our notation. The reader is referred to [7] for more details on

the subject of tree-automata and to [22] for term rewriting.

## 2.1. Sets, binary relations

Abstract rewriting. Given a set E, we denote by  $\mathcal{P}(E)$  its powerset i.e. the set of all its subsets. For every sets E, F and every binary relation  $\to \subseteq E \times F$ , and every subsets  $E' \subseteq E, F' \subseteq F$ , we denote by  $E' \to F'$  the fact that  $\exists e \in E', \exists f \in F', e \to f$ . We sometimes abusively note  $e \to F$  for what should be written  $\{e\} \to F$ .

The inverse binary relation  $\rightarrow^{-1}$  is defined by

$$\forall f \in F, \forall e \in E, f \to^{-1} e \Leftrightarrow e \to f.$$

We note  $\to^0 = \mathrm{Id}_E, \to^1 = \to$ , for every  $n \ge 1 \to^{n+1} = \to \circ \to^n$  and finally:

$$\rightarrow^* := \bigcup_{n=0}^{\infty} \rightarrow^n$$
.

The relation  $\to^*$  is the reflexive and transitive closure of the binary relation  $\to$ . A finite derivation w.r.t. the relation  $\to$ , is a sequence

$$D = (t_0, t_1, \dots t_i, t_{i+1}, \dots t_n) \tag{1}$$

such that, for every  $i \in [0, n-1], t_i \to t_{i+1}$ .

Given a subset  $T \subseteq E$ , we define

$$(\rightarrow^*)[T] = \{ s \in E \mid s \to^* t \text{ for some } t \in T \}$$
 (2)

and

$$[T](\to^*) = \{ s \in E \mid t \to^* s \text{ for some } t \in T \}$$
 (3)

Simulation. Let E, F be two sets endowed with binary relations  $\to_E \subseteq E \times E, \to_F \subseteq F \times F$ .

**Definition 2.1.** A binary relation  $R \subseteq E \times F$  is called a simulation of the structure  $(E, \rightarrow_E)$  by the structure  $(F, \rightarrow_F)$  iff

$$\forall e_1, e_2 \in E, \forall f_1 \in F, [((e_1 \to_E e_2) \land (e_1 R f_1)) \Rightarrow (\exists f_2 \in F, (f_1 \to_F f_2) \land (e_2 R f_2))]$$

This is essentially the classical notion of simulation defined in [28], excepted that we do not impose on R to be everywhere defined.

#### 2.2. Words and Terms

A finite word over an alphabet A is a map  $u:[0,\ell-1]\to A$  for some  $\ell\in\mathbb{N}$ . The integer  $\ell$  is the length of the word u and is denoted by |u|. The set of words over A is denoted by  $A^*$  and endowed with the usual concatenation operation  $u,v\in A^*\mapsto u\cdot v\in A^*$ . The empty word is denoted by  $\varepsilon$ . A word u is a prefix of a word v iff there exists some  $v\in A^*$  such that v=uv. We denote by v the fact that v is a prefix of v and by v the fact that v are incomparable for the ordering v i.e.

$$u \perp v \Leftrightarrow \neg(u \leq v) \& \neg(v \leq u).$$

The incomparability relation is extended to sets of words by: for every  $P, Q \subseteq A^*$ ,

$$P \perp Q \iff [\forall u \in P, \forall v \in Q, u \perp v].$$

Given a total order on A, we denote by  $u \leq_{lex} v$  the fact that u is lexicographically smaller than ( or equal to ) v.

Given  $w \in A^* \setminus \{\varepsilon\}$ , we denote by  $\mathsf{last}(w)$  the last (i.e. rightmost) letter of w.

We call *signature* a set of symbols  $\mathcal{F}$  with fixed arity  $\operatorname{ar}: \mathcal{F} \to \mathbb{N}$ . The subset of symbols of arity m is denoted by  $\mathcal{F}_m$ .

As usual, a set  $P \subseteq \mathbb{N}^*$  is called a *tree-domain* (or, domain, for short) iff, for every  $u \in \mathbb{N}^*$ ,  $i \in \mathbb{N}$ 

$$(u \cdot i \in P \Rightarrow u \in P) \& (u \cdot (i+1) \in P \Rightarrow u \cdot i \in P).$$

We call  $P' \subseteq P$  a *subdomain* of P iff, P' is a domain and, for every  $u \in P, i \in \mathbb{N}$ 

$$(u \cdot i \in P' \& u \cdot (i+1) \in P) \Rightarrow u \cdot (i+1) \in P'.$$

Given  $Q \subseteq P$ , the closure of Q in the tree-domain P, denoted  $\mathsf{CL}(Q,P)$ , is the smallest superset of Q which is a subdomain of P. A chain of a tree-domain P is a subset  $C \subseteq P$  which is linearly ordered by  $\preceq$ . A subset  $P' \subseteq P$  is called a path of P iff it is a chain, which is an interval i.e.:  $\forall x, z \in P', \forall y \in P, x \leq y \leq z \Rightarrow y \in P'$ . A subset  $B \subseteq P$  is called a branch of P iff it is a chain, which is maximal for inclusion (note that every branch is also a path). An antichain of P is a subset  $X \subseteq P$  such that, for every  $u, u' \in X$ ,  $u \preceq u' \Rightarrow u = u'$ . We often denote a finite antichain by the sequence of its elements in increasing lexicographic order. We sometimes do not distinguish between the antichain and this sequence. A subset  $T \subseteq P$  is

called a *transversal* of P iff it is an antichain, which is maximal for inclusion. The ordering  $\leq$  is extended to transversals in the following way:  $T \leq T'$  iff,  $\forall u \in T, \exists u' \in T', u \leq u'$ .

**Lemma 2.2.** Let  $P \subseteq \mathbb{N}^*$  be a tree domain. Let  $Y \subseteq P$  be an antichain. There exists a transversal Z of P such that

1-  $Y \subseteq Z$ 

2- for every transversal T of P,  $Y \subseteq T \Rightarrow Z \preceq T$ 

 $\textit{3-} \ \forall z \in Z, \forall v \in P, \exists y \in Y, (v \prec z \Rightarrow v \prec y).$ 

Sketch of proof. Let

$$Z := \{ z \in P \mid \exists y \in Y, \exists u \in P, \exists \alpha \in \mathbb{N}, u \prec y \& z = u \cdot \alpha \& (\forall y' \in Y, z \not\prec y') \}.$$

This set Z fulfills points 
$$(1)(2)(3)$$
.

After Lemma 2.2, we denote by Tr(Y, P) the transversal Z determined by Y and P and we call it the *smallest transversal* containing the antichain Y of the tree-domain P.

Given  $Q \subseteq P \subseteq \mathbb{N}^*$  we call *frontier* of Q in P, the set

$$fr(Q, P) := \{ u \cdot i \mid u \in Q, i \in \mathbb{N}, u \cdot i \in P \}.$$

A (first-order) term on a signature  $\mathcal{F}$  is a partial map  $t: \mathbb{N}^* \to \mathcal{F}$  whose domain is a tree-domain and which respects the arities. We denote by  $\mathcal{T}(\mathcal{F}, \mathcal{V})$  the set of first-order terms built upon the signature  $\mathcal{F} \cup \mathcal{V}$ , where  $\mathcal{F}$  is a denumerable signature and  $\mathcal{V}$  is a denumerable set of variables of arity 0.

The domain of t is also called its set of positions and denoted by  $\mathcal{P}os(t)$ . The set of variable positions (resp. non variable positions) of a term t is denoted by  $\mathcal{P}os_{\mathcal{V}}(t)$  (resp.  $\mathcal{P}os_{\overline{\mathcal{V}}}(t)$ ). The set of leaves of t is the set of positions  $u \in \mathcal{P}os(t)$  such that  $u \cdot \mathbb{N} \cap \mathcal{P}os(t) = \emptyset$ . It is denoted by  $\mathcal{L}v(t)$ . The set of internal nodes of t is the set of positions  $u \in \mathcal{P}os(t)$  such that  $u \cdot \mathbb{N} \cap \mathcal{P}os(t) \neq \emptyset$ . It is denoted by  $\mathcal{I}n(t)$ . We write  $\mathcal{P}os^+(t)$  for  $\mathcal{P}os(t) \setminus \{\varepsilon\}$ . If  $u, v \in \mathcal{P}os(t)$  and  $u \leq v$ , we say that u is an ancestor of v in t. Given  $v \in \mathcal{P}os^+(t)$ , its father is the position u such that v = uw and |w| = 1. The depth of a term t is defined by:

$$dpt(t) := \sup\{|u| \mid u \in \mathcal{P}os_{\overline{\mathcal{V}}}(t)\} + 1.$$

Given a term t and  $u \in \mathcal{P}os(t)$  the subterm of t at u is denoted by t/u and defined by  $\mathcal{P}os(t/u) = \{w \mid uw \in \mathcal{P}os(t)\}$  and  $\forall w \in \mathcal{P}os(t/u), t/u(w) = t(uw)$ .

A term s is a prefix of the term t iff there exists a substitution  $\sigma$  such that  $s\sigma = t$ . A term containing no variable is called ground. The set of ground terms is abbreviated to  $\mathcal{T}(\mathcal{F})$  or  $\mathcal{T}$  whenever  $\mathcal{F}$  is understood. A term which does not contain twice the same variable is called linear. Given a linear term  $t \in \mathcal{T}(\mathcal{F}, \mathcal{V}), x \in \mathcal{V}ar(t)$ , we shall denote by pos(t, x) the position of x in t. Among all the variables, there is a special one designated by  $\square$ . A term containing exactly one occurrence of  $\square$  is called a context. We denote by  $\mathcal{C}_1(\mathcal{F})$  the set of all contexts over  $\mathcal{F}$ .

A context is usually denoted as C[]. If u is the position of  $\square$  in C[], C[t]denotes the term C[] where t has been substituted at position u. We also denote by  $C[]_u$  such a context and by  $C[t]_u$  the result of the substitution. Intuitively, the symbol  $\square$  denotes a "hole" in C, while C[t] denotes what is obtained by plugging the term t in the hole of C[]. A term s is a factor of the term t iff there exists a context  $C[]_u$  and a substitution  $\sigma$  such that  $t = C[s\sigma]_u$ . In this case, we call occurrence of s in t the subset of  $\mathcal{P}os(t)$ which corresponds to the non-variable positions of s i.e.  $u\mathcal{P}os_{\overline{\mathcal{V}}}(s)$ . Note that the only occurrence of a variable  $v \in \mathcal{V}$  in a term t, is  $\emptyset$  (by the above definition). Note also that the frontier of the occurrence of s in t is, by definition,  $fr(u\mathcal{P}os_{\overline{\mathcal{V}}}(s),\mathcal{P}os(t))$ : it is equal to  $u\mathcal{P}os_{\mathcal{V}}(s)$  i.e. to the "positions of the variable of s inside t" (but these variables need not label these positions in the term t). We denote by  $|t| := \mathsf{Card}(\mathcal{P}\mathsf{os}(t))$  the size of a term t. Two terms  $t, t' \in \mathcal{T}(\mathcal{F}, \mathcal{V})$  are called  $\alpha$ -equivalent iff, there exists a substitution  $\sigma: \mathcal{V} \to \mathcal{V}$  which is a permutation of the set  $\mathcal{V}$ , and such that  $t\sigma = t'$ . In this case we note  $t \equiv_{\alpha} t'$ .

#### 2.3. Semi-Thue systems

Let A be a set that we take as alphabet. A rewrite rule over the alphabet A is a pair  $u \to v$  of words in  $A^*$ . We call u (resp. v) the left-handside (resp. right-handside) of the rule (lhs and rhs for short). A semi-Thue system is a pair (S,A) where A is an alphabet and S a set of rewrite rules built upon the alphabet A. When A is clear from the context or contains exactly the symbols occurring in S, we may omit A and write simply S. We call size of the set of rules S the number  $||S|| := \sum_{u \to v \in S} |u| + |v|$ . The one-step derivation generated by S (which is denoted by  $\to_S$ ) is defined by: for every  $f, g \in A^*, f \to_S g$  iff there exists  $u \to v \in S$  and  $\alpha, \beta \in A^*$  such that  $f = \alpha u \beta$  and  $g = \alpha v \beta$ . The relation  $\to_S^*$  (defined in section 2.1) is also called the derivation generated by S.

The semi-Thue system (S, A) is called *length-increasing* (resp. strict) iff, for every  $u \to v \in S$ ,  $|u| \le |v|$  (resp. |u| < |v|).

## 2.4. Term rewriting systems

A rewrite rule built over the signature  $\mathcal{F}$  is a pair  $l \to r$  of terms in  $\mathcal{T}(\mathcal{F}, \mathcal{V})$  which satisfy  $\mathcal{V}ar(r) \subseteq \mathcal{V}ar(l)$ . We call l (resp. r) the left-handside (resp. right-handside) of the rule (lhs and rhs for short). A rule is ground if both its left and right-handsides are ground. A rule is linear if both its left and right-handsides are linear. A rule is left-linear if its left-handside is linear.

A term rewriting system (system for short) is a pair  $(\mathcal{R}, \mathcal{F})$  where  $\mathcal{F}$  is a signature and  $\mathcal{R}$  a set of rewrite rules built upon the signature  $\mathcal{F}$ . When  $\mathcal{F}$  is clear from the context or contains exactly the symbols of  $\mathcal{R}$ , we may omit  $\mathcal{F}$  and write simply  $\mathcal{R}$ . We call size of the set of rules  $\mathcal{R}$  the number  $\|\mathcal{R}\| := \sum_{l \to r \in \mathcal{R}} |l| + |r|$ . We define the maximum arity of  $\mathcal{R}$  as the number

$$A(\mathcal{R}) := \max\{Card(\mathcal{P}os_{\mathcal{V}}(l)) \mid l \to r \in \mathcal{R}\}.$$

A system is ground (resp. linear, left-linear) if each of its rules is ground (resp. linear, left-linear). A system  $\mathcal{R}$  is shallow [19] if, in every side of rule, variables can occur only at depth 0 or 1. A system  $\mathcal{R}$  is growing [21] if every variable of a right-handside is at depth at most 1 in the corresponding left-handside. Rewriting is defined as usual: for every  $t, t' \in \mathcal{T}(\mathcal{F}, \mathcal{V}), t \to_{\mathcal{R}} t'$  means that there exists  $C \in \mathcal{C}_1(\mathcal{F} \cup \mathcal{V}), l \to r \in \mathcal{R}, \sigma : \mathcal{V} \to \mathcal{T}(\mathcal{F}, \mathcal{V})$  such that

$$t = C[l\sigma]_u, \quad t' = C[r\sigma]_u. \tag{4}$$

For this step:  $l \to r$  is the rule used,  $l\sigma$  is the redex and  $r\sigma$  is the contractum. Let us fix some one-step derivation (4) and denote by u the position of the hole in C. Let  $v \in \mathcal{P}os(t), v' \in \mathcal{P}os(t')$ . We call v' a residue of v, w.r.t. the one-step derivation (4), iff

there exists  $x \in \mathcal{V}ar(l) \cap \mathcal{V}ar(r), w \in \mathcal{P}os(x\sigma), v_1 \in \mathcal{P}os(l), v_1' \in \mathcal{P}os(r)$  such that

$$l(v_1) = x, r(v_1') = x, v = uv_1w, v' = uv_1'w,$$
(5)

or

$$v = v', v \in \mathcal{P}os(C) \text{ and } v \perp u.$$
 (6)

This notion extends to sets of positions in the following way: a subset  $P' \subseteq \mathcal{P}os(t')$  is a *residue* of a subset  $P \subseteq \mathcal{P}os(t)$ , w.r.t. the one-step derivation

(4), iff

there exists  $x \in \mathcal{V}ar(l) \cap \mathcal{V}ar(r), Q \subseteq \mathcal{P}os(x\sigma), v_1 \in \mathcal{P}os(l), v_1' \in \mathcal{P}os(r)$  such that

$$l(v_1) = x, r(v_1') = x, P = uv_1Q, P' = uv_1'Q.$$
(7)

or

$$P = P' \subseteq \mathcal{P}os(C) \text{ and } \{u\} \perp P.$$
 (8)

Given a derivation

$$D: t_0 \to_{\mathcal{R}} t_1 \to_{\mathcal{R}} \cdots t_i \to_{\mathcal{R}} t_{i+1} \to_{\mathcal{R}} \cdots t_n$$

and  $v \in \mathcal{P}os(t_0), v' \in \mathcal{P}os(t_n)$ , we call v' a residue of v, w.r.t. derivation D, iff, there exists positions  $v_i \in \mathcal{P}os(t_i)$  for  $0 \le i \le n$  such that,  $v = v_0$ , for every  $i \in [0, n-1]$ ,  $v_{i+1}$  is a residue of  $v_i$  w.r.t. the i-th step of derivation D and  $v_n = v'$ .

**Remark 2.3.** The notion of derivation used here consists, in fact, not merely in a sequence of terms (as is defined in  $\S 1$ ) but in a sequence of rewriting steps, each of them being defined by a rule and a position.

Similarly, if  $P \subseteq \mathcal{P}os(t_0)$  and  $P' \subseteq \mathcal{P}os(t_n)$ , we call P' a residue of P, w.r.t. derivation D, iff, there exist subsets  $P_i \subseteq \mathcal{P}os(t_i)$  for  $0 \le i \le n$  such that,  $P = P_0$ , for every  $i \in [0, n-1]$ ,  $P_{i+1}$  is a residue of  $P_i$  w.r.t. the i-th step of derivation D and  $P_n = P'$ . When  $P \subseteq \mathcal{P}os(t_0)$  is an occurrence of a term s we say that the subterm  $t_n/v'$  is a residue of the subterm  $t_0/v$  w.r.t. D. A notion of descendant of v, w.r.t. derivation D is obtained by removing the incomparability restriction in condition (6); and similarly, a notion of descendant of P, w.r.t. derivation D by removing the incomparability restriction in condition (8).

#### 2.5. Words viewed as Terms

In order to transfer every definition (or statement) about Term Rewriting Systems into a similar one about Semi-Thue systems, we define here precisely an embedding of the set of words (resp. semi-Thue systems) over an alphabet A into the set of terms (resp. Term Rewriting Systems) over some signature  $\mathcal{F}$ .

Let A be some alphabet. We define the signature  $\mathcal{F}(A)$  by

$$\mathcal{F}(A) := A \cup \{\#_0\}, \ \forall a \in A, \mathsf{ar}(a) = 1 \text{ and } \mathsf{ar}(\#_0) = 0.$$

We define two mappings  $\mathcal{F}_i: A^* \to \mathcal{T}(\mathcal{F}(A), \{\Box\})$   $(i \in \{0,1\})$  by setting:

$$\mathcal{F}_1(\varepsilon) = \square$$
,  $\mathcal{F}_1(a_1 a_2 \cdots a_n) = a_1(a_2(\dots(a_n(\square))\dots))$ ,

$$\mathcal{F}_0(\varepsilon) = \#_0, \ \mathcal{F}_0(a_1 a_2 \cdots a_n) = a_1(a_2(\dots(a_n(\#_0))\dots)),$$

Note that, for every word w,  $\mathcal{F}_1(w)$  is a context while  $\mathcal{F}_0(w)$  is a ground term. We associate with every rewriting rule  $u \to v$ , the (term) rewriting rule

$$\mathcal{F}(u \to v) := \mathcal{F}_1(u) \to \mathcal{F}_1(v),$$

and with every semi-Thue system (S, A) the term-rewriting system

$$(\mathcal{F}(S), \mathcal{F}(A))$$
 where  $\mathcal{F}(S) := \{ \mathcal{F}(u \to v) \mid u \to v \in S \}.$ 

The following lemma is straightforward

**Lemma 2.4.** Let (S, A) be a semi-Thue system and  $w, w' \in A^*$ . Then  $w \to_S w' \Leftrightarrow \mathcal{F}_0(w) \to_{\mathcal{F}(S)} \mathcal{F}_0(w') \Leftrightarrow \mathcal{F}_1(w) \to_{\mathcal{F}(S)} \mathcal{F}_1(w')$ .

In the sequel, the explicit application of  $\mathcal{F}_1$  will be sometimes omitted: if  $w \in A^*$  and  $t \in \mathcal{T}(\mathcal{F}(A), \{\Box\})$ , the expression w(t) will denote the unary term  $\mathcal{F}_1(w)[t]$ .

#### 2.6. Automata

We shall consider bottom-up finite term (tree) automata only [7] (which we abbreviate to f.t.a). A f.t.a is a 4-tuple  $\mathcal{A} := (\mathcal{F}, Q, Q_f, \Gamma)$  where  $\mathcal{F}$  is the signature, Q is a finite set of symbols of arity 0, called the set of *states*,  $Q_f$  is the set of *final* states,  $\Gamma$  is the set of *transitions*. Every element of  $\Gamma$  has the form

$$q \to q'$$
 (9)

for some  $q, q' \in Q$ , or

$$f(q_1, \dots, q_m) \to q \tag{10}$$

for some  $m \geq 0, f \in \mathcal{F}_m, q_1, \ldots, q_m \in Q$ . The size of  $\mathcal{A}$  is defined by:  $\|\mathcal{A}\| := \mathsf{Card}(\Gamma) + \mathsf{Card}(Q)$ . The set of rules  $\Gamma$  can be viewed as a rewriting system over the signature  $\mathcal{F} \cup Q$ . We then denote by  $\to_{\Gamma}$  or by  $\to_{\mathcal{A}}$  (resp. by  $\to_{\Gamma}^*$  or by  $\to_{\mathcal{A}}^*$ ) the one-step rewriting relation (resp. the rewriting relation) generated by  $\Gamma$ .

Given an automaton  $\mathcal{A}$ , the set of terms accepted by  $\mathcal{A}$  is defined by:

$$L(\mathcal{A}) := \{ t \in \mathcal{T}(\mathcal{F}) \mid \exists q \in Q_f, t \to_{\mathcal{A}}^* q \}.$$

A set of terms T is recognizable if there exists a finite term automaton  $\mathcal{A}$  such that  $T = L(\mathcal{A})$ .

The automaton  $\mathcal{A}$  is called *deterministic* iff

D1-  $\Gamma$  posesses no rule of the form (9)

D2- for every  $t, u, u' \in \mathcal{T}(\mathcal{F} \cup Q)$ ,

$$(t \to u \in \Gamma \& t \to u' \in \Gamma) \Rightarrow (u = u').$$

The automaton  $\mathcal{A}$  is called *complete* iff for every  $m \geq 0$ ,  $f \in \mathcal{F}_m$  and m-tuple of states  $(q_1, \ldots, q_m) \in Q^m$ , either  $(m = 0 \text{ and } f \in Q)$  or, there exists  $q \in Q$  such that

$$f(q_1,\ldots,q_m)\to q\in\Gamma.$$

Beside the above usual properties we introduce here the notion of standard automaton as follows:

**Definition 2.5.** A f.t.a  $\mathcal{A} = (\mathcal{F}, Q, Q_f, \Gamma)$  is called standard iff it fulfills the four conditions:

1-  $\Gamma$  posesses no rule of the form (9)

2-  $\mathcal{F}_0 \subseteq Q$ 

3- every rule (10) of A is such that  $m \geq 1$ 

4- for every  $m \geq 1$ ,  $f \in \mathcal{F}_m$ ,  $q_1, \ldots, q_m \in Q$  there exists a unique  $q \in Q$  such that  $f(q_1, \ldots, q_m) \to_{\mathcal{A}} q$ .

Note that our definition of the notion of f.t.a corresponds to the notion of generalized finite term automaton of [7] (it is slightly more general than the usual one) while the above notion of standard f.t.a is more restricted than the usual notion of deterministic and complete f.t.a (we have, in some sense, removed the "initial" rules of the form  $f \to_{\mathcal{A}} q$  for symbols  $f \in \mathcal{F}_0$  and included the alphabet  $\mathcal{F}_0$  in Q). Note that, for a standard f.t.a  $\mathcal{A}$ , the relation  $\to_{\mathcal{A}}$  strictly reduces the size of terms. We give later on, in §4.2.2, a precise procedure transforming any f.t.a  $\mathcal{A}$  into a standard f.t.a  $\hat{A}$  with "similar" rewriting relation, hence recognizing the same language. Therefore most theorems will assert properties for f.t.a 's while most proofs will only manipulate standard f.t.a 's.

## 2.7. Automata and rewriting

A system  $\mathcal{R}$  is recognizability preserving if  $[T](\to_{\mathcal{R}}^*)$  is recognizable for every recognizable T.

A system  $\mathcal{R}$  is inverse recognizability preserving if  $(\to_{\mathcal{R}}^*)[T]$  is recognizable for every recognizable T or equivalently if  $\mathcal{R}^{-1}$  is recognizability preserving.

Some technical notions. The following lemma extends the property of determinism to tree-domains larger than just a single point.

**Lemma 2.6.** Let  $\mathcal{A}$  be some standard f.t.a over the signature  $\mathcal{F}$ . Let  $t, t_1, t_2 \in \mathcal{T}(\mathcal{F} \cup Q)$ . If  $t \to_{\mathcal{A}}^* t_1, t \to_{\mathcal{A}}^* t_2$  and  $\mathcal{P}os(t_1) = \mathcal{P}os(t_2)$ , then  $t_1 = t_2$ .

We extend to subdomains the usual notion of state reached by some deterministic complete f.t.a from a given term t: we call it the reduct of t over the subdomain P.

**Definition 2.7** ( $\mathcal{A}$ -reduct). Let  $\mathcal{A}$  be some standard f.t.a over the signature  $\mathcal{F}$ . Let  $t \in \mathcal{T}(\mathcal{F} \cup Q)$  and let P be some subdomain of  $\mathcal{P}$ os(t). We define Red(t,P)=t' as the unique element of  $\mathcal{T}(\mathcal{F} \cup Q)$  such that  $1\text{-}\mathcal{P}$ os(t')=P  $2\text{-}t \to_{\mathcal{A}}^* t'$ 

The existence and unicity of such a term Red(t, P) follows from the technical conditions imposed by Definition 2.5.

**Lemma 2.8.** Let  $\mathcal{A}$  be some standard f.t.a over the signature  $\mathcal{F}$ . Let  $t, t_1, t_2 \in \mathcal{T}(\mathcal{F} \cup Q)$ . If  $t \to_{\mathcal{A}}^* t_1, t \to_{\mathcal{A}}^* t_2$  and  $\mathcal{P}os(t_1) \subseteq \mathcal{P}os(t_2)$ , then  $t_2 \to_{\mathcal{A}}^* t_1$ .

Proof. Since 
$$t \to_{\mathcal{A}}^* t_1, t \to_{\mathcal{A}}^* t_2 \to_{\mathcal{A}}^* \operatorname{Red}(t_2, \mathcal{P}os(t_1))$$
 and  $\mathcal{P}os(t_1) = \mathcal{P}os(\operatorname{Red}(t_2, \mathcal{P}os(t_1)),$  by Lemma 2.6,  $t_1 = \operatorname{Red}(t_2, \mathcal{P}os(t_1))$  which implies that  $t_2 \to_{\mathcal{A}}^* t_1$ .

#### 3. Bottom-up rewriting

In order to define bottom-up rewriting, we need some marking tools. In the following we assume that  $\mathcal{F}$  is a signature. We shall illustrate many of our definitions with the following system  $(\mathcal{R}_1, \mathcal{F})$ 

**Example 3.1.** 
$$\mathcal{R}_1 = \{ f(x) \to g(x), g(h(x)) \to i(x), i(x) \to a \}, \mathcal{F} = \{ a, f, g, h, i \}$$
 with  $ar(a) = 0, ar(f) = 1, ar(g) = 1, ar(h) = 1, ar(i) = 1.$ 

## 3.1. Marking

As in [17], we may mark the symbols of a term using natural integers.

Marked symbols

**Definition 3.2.** We define the (infinite) signature of marked symbols:  $\mathcal{F}^{\mathbb{N}} = \{ f^i \mid f \in \mathcal{F}, i \in \mathbb{N} \}.$ 

For every integer  $k \geq 0$  we note:  $\mathcal{F}^{\leq k} = \{f^i \mid f \in \mathcal{F}, 0 \leq i \leq k\}$ . The mapping  $m : \mathcal{F}^{\mathbb{N}} \to \mathbb{N}$  maps every marked symbol into its mark:  $m(f^i) = i$ .

Marked terms

**Definition 3.3.** The terms in  $\mathcal{T}(\mathcal{F}^{\mathbb{N}}, \mathcal{V})$  are called marked terms.

The mapping **m** is extended to marked terms by:

if  $t \in \mathcal{V}$ , m(t) = 0, otherwise,  $m(t) = m(t(\varepsilon))$ .

For every  $f \in \mathcal{F}$ , we identify  $f^0$  and f; it follows that  $\mathcal{F} \subset \mathcal{F}^{\mathbb{N}}$ ,  $\mathcal{T}(\mathcal{F}) \subset \mathcal{T}(\mathcal{F}^{\mathbb{N}})$  and  $\mathcal{T}(\mathcal{F}, \mathcal{V}) \subset \mathcal{T}(\mathcal{F}^{\mathbb{N}}, \mathcal{V})$ .

**Example.** 
$$m(a^2) = 2$$
,  $m(i(a^2)) = 0$ ,  $m(h^1(a)) = 1$ ,  $m(h^1(x)) = 1$ ,  $m(x) = 0$ .

**Definition 3.4.** Given  $t \in \mathcal{T}(\mathcal{F}^{\mathbb{N}}, \mathcal{V})$  and  $i \in \mathbb{N}$ , we define the marked term  $t^i$  whose marks are all equal to i:

if t is a variable x 
$$t^i = x$$
  
if t is a constant c  $t^i = c^i$   
otherwise  $(t = f(t_1, ..., t_n))$  where  $n \ge 1$   $t^i = f^i(t_1^i, ..., t_n^i)$ 

This marking extends to sets of terms S ( $S^i = \{t^i \mid t \in S\}$ ) and substitutions  $\sigma$  ( $\sigma^i : x \mapsto (x\sigma)^i$ ).

We use  $\mathsf{mmax}(t)$  (resp.  $\mathsf{mmin}(t)$ ) to denote the maximal (resp. minimal) mark of a marked term t.

$$mmax(t) := max\{m(t/u) \mid u \in \mathcal{P}os(t)\}$$

$$mmin(t) := min\{m(t/u) \mid u \in \mathcal{P}os(t)\}$$

For  $u \in \mathcal{P}os^+(t)$ ,  $mmax^{\prec u}(t) := max\{m(t/v) \mid v \prec u\}$ .

Example. 
$$mmax(i(a^2)) = 2$$
,  $mmin(i(a^2)) = 0$ ,  $mmax^{1.1}(g(h^1(a^2))) = 1$ .

Notation: in the sequel, given a term  $t \in \mathcal{T}(\mathcal{F}, \mathcal{V})$ ,  $\overline{t}$  will always refer to a term of  $\mathcal{T}(\mathcal{F}^{\mathbb{N}}, \mathcal{V})$  such that  $\overline{t}^0 = t$ . The same rule will apply to substitutions and contexts.

Finite automata and marked terms. Given a f.t.a  $\mathcal{A} = (\mathcal{F}, Q, Q_f, \Gamma)$  we extend it over the signature  $\mathcal{F}^{\leq k}$ , by setting

$$\Gamma^{\leq k} := \{ (f^j(q_1^{j_1}, \dots, q_n^{j_n}) \to q^j) \mid (f(q_1, \dots, q_n \to q) \in \Gamma, j, j_1, \dots, j_n \in [0, k] \},$$

and

$$\mathcal{A}^{\leq k} := (\mathcal{F}^{\leq k}, Q^{\leq k}, Q_f^{\leq k}, \Gamma^{\leq k}).$$

Since, for every integers k, k',  $\mathcal{A}^{\leq k}$  and  $\mathcal{A}^{\leq k'}$  have the same action on terms with marks not greater than  $\min(k, k')$ , we often denote by  $\mathcal{A}$  any extension  $\mathcal{A}^{\leq k}$  with a sufficiently large k w.r.t. the terms under consideration.

 $\mathbb{N}$  acts on marked terms. We define a right-action  $\odot$  of the monoid  $(\mathbb{N}, \max, 0)$  over the set  $\mathcal{F}^{\mathbb{N}}$  which just consists in applying the operation max on every mark: for every  $\bar{t} \in \mathcal{F}^{\mathbb{N}}$ ,  $n \in \mathbb{N}$ ,

$$\mathcal{P}\mathsf{os}(\bar{t}\odot n) := \mathcal{P}\mathsf{os}(\bar{t}), \ \forall u \in \mathcal{P}\mathsf{os}(\bar{t}), \\ \mathsf{m}((\bar{t}\odot n)/u) := \max(\mathsf{m}(\bar{t}/u), n), \ (\bar{t}\odot n)^0 = \bar{t}^0$$

Since a marked term can be viewed as a map from its domain to the direct product  $\mathcal{F} \times \mathbb{N}$ , and since the operation  $\odot$  acts on the second component only while every f.t.a acts on the first component only, the following statement is straightforward.

**Lemma 3.5.** Let  $\mathcal{A}$  be some finite term automaton over  $\mathcal{F}$ ,  $\bar{s}, \bar{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$  and  $n \in \mathbb{N}$ . If  $\bar{s} \to_{\mathcal{A}}^* \bar{t}$  then  $(\bar{s} \odot n) \to_{\mathcal{A}}^* (\bar{t} \odot n)$ .

Marked rewriting

We define here the rewrite relation  $\hookrightarrow$  between marked terms. For every linear marked term  $\bar{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}}, \mathcal{V})$  and variable  $x \in \mathcal{V}ar(\bar{t})$ , we define:

$$\mathsf{M}(\overline{t}, x) = \sup\{\mathsf{m}(\overline{t}/w) \mid w \prec \mathsf{pos}(\overline{t}, x)\} + 1. \tag{11}$$

Let  $\mathcal{R}$  be a left-linear system,  $\overline{s} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$  and  $t \in \mathcal{T}$ . Let us suppose that  $\overline{s} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$  decomposes as

$$\overline{s} = \overline{C}[\overline{l}\overline{\sigma}]_v, \text{ with } (l,r) \in \mathcal{R},$$
 (12)

for some marked context  $\overline{C}[]_v$  and substitution  $\overline{\sigma}$ . We define a new marked substitution  $\overline{\overline{\sigma}}$  (such that  $\overline{\overline{\sigma}}^0 = \overline{\sigma}^0$ ) by: for every  $x \in \mathcal{V}ar(r)$ ,

$$x\overline{\overline{\sigma}} := (x\overline{\sigma}) \odot M(\overline{C}[\overline{l}], x). \tag{13}$$

We then write  $\overline{s} \hookrightarrow \overline{t}$  where

$$\overline{s} = \overline{C}[\overline{l}\overline{\sigma}], \ \overline{t} = \overline{C}[r\overline{\overline{\sigma}}].$$
 (14)

(This is illustrated by Figure 1, where M denotes  $M(\overline{C}[\overline{l}], x)$  and the marks are written between brackets  $\langle \ldots \rangle$ ). More precisely, an ordered pair of marked terms  $(\overline{s}, \overline{t})$  is linked by the relation  $\hookrightarrow$  iff, there exists  $\overline{C}[]_v, (l, r), \overline{l}, \overline{\sigma}$  and  $\overline{\overline{\sigma}}$  fulfilling equations (12-14). The intuitive idea behind the above definition is that the marks are storing the relevant information concerning the *ordering* of successive positions of redexes during the derivation. A mark k will roughly

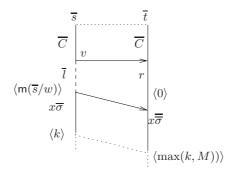

Figure 1: A marked rewriting step

mean that there were k successive applications of rules, each one with a leaf of the left-handside at a position strictly greater than a leaf of the previous right-handside.

The map  $\overline{s} \mapsto \overline{s}^0$  (from marked terms to unmarked terms) extends into a map from marked derivations to unmarked derivations: every

$$\overline{s}_0 = \overline{C}_0[\overline{l}_0 \overline{\sigma}_0]_{v_0} \hookrightarrow \overline{C}_0[r_0 \overline{\overline{\sigma}}_0]_{v_0} = \overline{s}_1 \hookrightarrow \dots \overline{C}_{n-1}[r_{n-1} \overline{\overline{\sigma}}_{n-1}]_{v_{n-1}} = \overline{s}_n \quad (15)$$

is mapped to the derivation

$$s_0 = C_0[l_0\sigma_0]_{v_0} \to C_0[r_0\sigma_0]_{v_0} = s_1 \to \dots C_{n-1}[r_{n-1}\sigma_{n-1}]_{v_{n-1}} = s_n.$$
 (16)

The context  $\overline{C}_i[]_{v_i}$ , the rule  $(l_i, r_i)$ , the marked version  $\overline{l}_i$  of  $l_i$  and the substitution  $\overline{\sigma}_i$  completely determine  $\overline{s}_{i+1}$ . Thus, for every fixed pair  $(\overline{s_0}, s_0)$ , this map is a bijection from the set of derivations (15) starting from  $\overline{s_0}$ , to the set of derivations (16) starting from  $s_0$ .

**Example 3.6.** With the system  $\mathcal{R}_1$  of Example 3.1 we get the following marked derivation:

$$\begin{array}{l} f(h(f(h(a)))) \, \hookrightarrow \, f(h(g(h^1(a^1)))) \, \hookrightarrow \, f(h(i(a^2))) \, \hookrightarrow \, f(h(a)) \, \hookrightarrow \\ g(h^1(a^1)) \, \hookrightarrow \, i(a^2) \, \hookrightarrow \, a \end{array}$$

From now on, each time we deal with a derivation  $s \to^* t$  between two terms  $s, t \in \mathcal{T}(\mathcal{F}, \mathcal{V})$ , we may implicitly decompose it as (16) where n is the length of the derivation,  $s = s_0$  and  $t = s_n$ .

#### 3.2. Bottom-up derivations

**Definition 3.7.** The marked derivation (15) is weakly bottom-up if, for every  $0 \le i < n$ ,

$$l_i \notin \mathcal{V} \Rightarrow \mathsf{m}(\overline{l_i}) = 0,$$
 (17)

$$l_i \in \mathcal{V} \implies \sup\{\mathsf{m}(\overline{s_i}/u) \mid u \prec v_i\} = 0. \tag{18}$$

(Handling the case where some lhs are just variables is worthwhile: for example the systems of [2], when viewed as term rewriting systems, have all their lhs in  $\mathcal{V}$ ).

**Definition 3.8.** The derivation (16) is weakly bottom-up if the corresponding marked derivation (15) starting on the same term  $\bar{s} = s$  is weakly bottom-up (following the above definition).

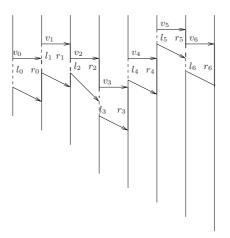

Figure 2: A wbu derivation

**Remark 3.9.** An alternative formulation for defining a weakly bottom-up derivation is to say that no redex  $l_j\sigma_j$  is contracted at a position  $v_j$  strictly greater than a variable of a previous  $r_i$ . This means, in some sense, that the reductions are made in a "bottom-up" fashion, see Figure 2 and Figure 3.

We shall abbreviate "weakly bottom-up" to wbu. Note that the notion of wbu marked derivation is defined step by step. It is thus clear that the composition of two wbu marked derivations is wbu too. This might be false

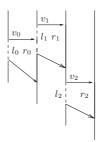

Figure 3: A non wbu derivation

for wbu unmarked derivations. In the following we thus mainly handle *marked* wbu derivations.

The next lemma shows that in the case of a linear system, a derivation can always be replaced by a wbu-derivation.

**Lemma 3.10.** Let  $\mathcal{R}$  be a linear system. If  $s \to_{\mathcal{R}}^* t$  then there exists a wbu-derivation between s and t.

Sketch of proof. We prove by induction on the integer n, that, for every derivation  $s \to^n t$ , there exists a wbu-derivation from s to t, with the same length n and reducing the same redexes of s

Basis: n = 0

then s = t; the empty derivation is wbu.

Induction step: n > 0

As  $\mathcal{R}$  is linear, every redex may have at most one descendant in each term of the derivation. We choose a redex  $l\sigma$  ( $l \to r \in \mathcal{R}$ ) of s, whose position is maximal (w.r.t.  $\preceq$ ) among the set of positions of redexes contracted somewhere in the derivation  $s \to^n t$ ; let u be the position of this maximal redex in s. A new derivation can be obtained by transferring the contraction of  $l\sigma$  at the beginning of the derivation: we obtain a derivation of equal length

$$s = C[l\sigma]_u \to C[r\sigma]_u \to^{n-1} t. \tag{19}$$

By induction hypothesis, the derivation  $C[r\sigma]_u \to^{n-1} t$  can be made wbu while preserving its length n-1 and the set of redexes of  $C[r\sigma]_u$  that are contracted. Let us consider the unique marked derivation associated to (19):

$$s = C[l\sigma]_u \hookrightarrow C[r\overline{\overline{\sigma}}]_u \hookrightarrow^{n-1} \overline{\overline{t}}. \tag{20}$$

and the unique marked derivation associated to the wbu-derivation  $C[r\sigma]_u \to^{n-1} t$ :

$$C[r\sigma]_u \hookrightarrow^{n-1} \overline{t}. \tag{21}$$

By assumption and preservation of the redexes,  $\sigma$  does not contain any redex which is contracted inside the derivation  $C[r\sigma] \to^{n-1} t$ . Hence, the (j+1)th step of derivation (20) uses a lhs with a root that possesses the same mark as the root of the lhs of the jth step of derivation (21). Since this mark is always null in (21), it is also null in (20). This shows that (19) is wbu.

Note that, what the above lemma shows, is that the condition wbu is not a restriction on the associated "derivation-graph" (this notion is defined in [5] in the case of context-sensitive word grammars but could be extended to arbitrary linear term rewriting systems) but, rather on the *traversal* of this graph corresponding to the particular order in which the reductions are performed.

**Definition 3.11.** A marked term  $\overline{s}$  is said m-increasing iff, for every  $u, v \in \mathcal{P}os(\overline{s}), u \leq v \Rightarrow m(\overline{s}/u) \leq m(\overline{s}/v).$ 

**Lemma 3.12.** Suppose that  $\overline{s}$  is a m-increasing marked term,  $\overline{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}}, \mathcal{V}) \setminus \mathcal{V}$ ,  $\mathsf{m}(\overline{t}) = 0$ ,  $\overline{C}[]_v$  is a marked context,  $\overline{\sigma}$  is a marked substitution and  $\overline{s} = \overline{C}[\overline{t}\overline{\sigma}]_v$ .

Then,  $\overline{C}[]_v$  has no mark above the position v.

*Proof.* Let  $u \in \mathcal{P}os(\overline{C})$  such that  $u \prec v$  and  $\overline{C}(v) = \square$ . Since  $\overline{C}[\overline{t}\overline{\sigma}]$  is m-increasing,

$$\operatorname{m}(\overline{C}[\overline{t}\overline{\sigma}]/u) \leq \operatorname{m}(\overline{C}[\overline{t}\overline{\sigma}]/v)$$

But 
$$\mathbf{m}(\overline{C}[\overline{t}\overline{\sigma}]/v) = \mathbf{m}(\overline{t}) = 0.$$

**Lemma 3.13.** Let  $\overline{s} \hookrightarrow \overline{t}$  be a wbu marked derivation-step between  $\overline{s}, \overline{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$ . If  $\overline{s}$  is m-increasing, then  $\overline{t}$  is m-increasing too.

*Proof.* Suppose that  $\overline{s}$  is m-increasing and that  $\overline{s}$ ,  $\overline{t}$  fulfill (12-14). Let us consider  $v_1, v_2 \in \mathcal{P}os(\overline{t})$  such that  $v_1 \leq v_2$ . Let us show that

$$\mathsf{m}(\overline{t}/v_1) \le \mathsf{m}(\overline{t}/v_2). \tag{22}$$

We distinguish 3 cases depending on the relative positions of  $v, v_1, v_2$ . Case 1:  $v_1 \prec v$ .

Since the derivation step is wbu, we have  $\mathsf{m}(\overline{s}/v) = 0$ . According to the definition of a marked derivation-step, we have  $\mathsf{m}(\overline{s}/v_1) = \mathsf{m}(\overline{t}/v_1)$ . Moreover,  $\overline{s}$  is m-increasing. Hence,  $\mathsf{m}(\overline{s}/v) = \mathsf{m}(\overline{s}/v_1) = 0 \le \mathsf{m}(\overline{t}/v_2)$ .

Case 2:  $v \leq v_1$ .

If  $v_1 \in v \cdot \mathcal{P}os(r)$  then we have  $\mathsf{m}(\overline{t}/v_1) = 0 \leq \mathsf{m}(\overline{t}/v_2)$ . Otherwise,  $v_1 = v \cdot w \cdot w_1, v_2 = v \cdot w \cdot w_2$ , where x is the label of w in r and  $w_1, w_2 \in \mathcal{P}os(x\sigma)$ . Let

$$v_1' := v \cdot w' \cdot w_1, \ v_2' := v \cdot w' \cdot w_2$$

where  $w' = pos(\ell, x)$ .

Since  $\overline{s}$  is m-increasing,  $m(\overline{s}/v_1') \leq m(\overline{s}/v_2')$ , hence

$$\max(\mathsf{m}(\overline{s}/v_1'),\mathsf{M}(C[\overline{l}],x)) \le \max(\mathsf{m}(\overline{s}/v_2'),\mathsf{M}(C[\overline{l}],x))$$

i.e.  $\mathsf{m}(\overline{t}/v_1) \leq \mathsf{m}(\overline{t}/v_2)$ .

Case 3:  $v_1 \perp v$ .

In this case we also have  $v_2 \perp v$ . It follows that for every  $i \in \{1, 2\}$ ,  $\mathsf{m}(\overline{s}/v_i) = \mathsf{m}(\overline{t}/v_i)$ , and we can conclude as in case 1.

In all cases we have established that (22) holds.

The previous Lemma generalizes to a sequence.

**Lemma 3.14.** Let  $\overline{s} \hookrightarrow^* \overline{t}$  be a wbu marked derivation between  $\overline{s}, \overline{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$ . If  $\overline{s}$  is m-increasing, then  $\overline{t}$  is m-increasing too.

*Proof.* Straightforward induction on the length n of the derivation based on Lemma 3.13.

**Remark 3.15.** Let us examine the value of  $\mathsf{M}(\overline{C}[\overline{l}],x)$  when  $s' \circ \to^* \overline{s} = \overline{C}[\overline{l}\overline{\sigma}] \hookrightarrow \overline{C}[r\overline{\sigma}] = \overline{t}$ , and  $s' \to^* s$  is wbu:

- if C is the empty context and l = x then  $\mathsf{M}(\overline{C[l]}, x) = 1$
- otherwise, by Lemma 3.14,  $\mathsf{M}(\overline{C}[\overline{l}],x) = \mathsf{m}(\overline{C}[\overline{l}]/f_x) + 1$ , where  $f_x$  is the father of  $\mathsf{pos}(\overline{C}[\overline{l}],x)$ .

We classify the derivations according to the maximal value of the marks. We abbreviate "bottom-up" to bu.

**Definition 3.16.** A derivation is  $\mathsf{bu}(k)$  (resp.  $\mathsf{bu}^-(k)$ ) if it is wbu and, in the corresponding marked derivation  $\forall i \in [0, n], \mathsf{mmax}(\overline{s_i}) \leq k$  (resp.  $\forall i \in [0, n-1], \mathsf{mmax}(\overline{l_i}) < k$ ).

Let us introduce a convenient notation.

**Definition 3.17.** Let  $k \geq 1$ . The binary relation  $_k \circ \to_{\mathcal{R}}^*$  over  $\mathcal{T}(\mathcal{F}^{\mathbb{N}})$  is defined by:

 $\overline{s}_k \circ \to_{\mathcal{R}}^* \overline{t}$  if and only if there exists a wbu marked derivation from  $\overline{s}$  to  $\overline{t}$  where all the marks belong to [0, k].

The binary relation  $_k \rightarrow_{\mathcal{R}}^*$  over  $\mathcal{T}(\mathcal{F})$  is defined by:

 $s \underset{k}{\rightarrow_{\mathcal{R}}} t$  if and only if there exists a bu(k)-derivation from s to t.

**Example 3.18.** For the system  $\mathcal{R}_0 = \{f(f(x)) \to f(x)\}$  with the signature  $\mathcal{F} = \{a^{(0)}, f^{(1)}\}$ , although for every k we may get a bu(k)-derivation for a term of the form  $f(\ldots f(a)\ldots)$  with k+1 f symbols:

$$f(f(f(f(a)))) \hookrightarrow f(f^1(f^1(a^1))) \hookrightarrow f(f^2(a^2)) \hookrightarrow f(a^3)$$

we can always achieve a bu(1)-derivation:

$$f(f(f(f(a)))) \hookrightarrow f(f(f(a^1))) \hookrightarrow f(f(a^1)) \hookrightarrow f(a^1)$$

**Example** (comparison with innermost derivation). Let us consider the signature  $\mathcal{F} := \{a^{(0)}, f^{(1)}, g^{(1)}\}$  and the rewriting system  $\mathcal{R} := \{fg(x) \to gf(x), gf(x) \to h(x)\}$ . The derivation

$$\mathsf{fggg}(\mathsf{a}) \to \mathsf{gfgg}(\mathsf{a}) \to \mathsf{ggfg}(\mathsf{a}) \to \mathsf{gggf}(\mathsf{a})$$

corresponds to the marked derivation

$$\mathsf{fggg}(\mathsf{a}) \to \mathsf{gfg}^1\mathsf{g}^1(\mathsf{a}^1) \to \mathsf{ggfg}^2(\mathsf{a}^2) \to \mathsf{gggf}(\mathsf{a}^3)$$

which is not BU(2); note however, that this derivation is innermost i.e. each derivation step rewrites the innermost redex of the given term.

The derivation

$$fgfgfg(a) \rightarrow fgfhg(a) \rightarrow fhhg(a)$$

corresponds to the marked derivation

$$\mathsf{fgfgfg}(\mathsf{a}) \hookrightarrow \mathsf{fgfhg}^1(\mathsf{a}^1) \hookrightarrow \mathsf{fhh}^1\mathsf{g}^1(\mathsf{a}^1)$$

which is BU(1); note however, that this derivation is not innermost since the innermost redex of the first term is fg(a), which is not rewritten in this derivation.

## 3.3. Bottom-up systems

We introduce here a hierarchy of classes of rewriting systems <sup>1</sup> and show that several well-known classes of rewriting systems are included in the low levels of this hierarchy: namely the right-ground systems, the left-basic semi-Thue systems, the linear shallow systems and the linear growing systems.

**Definition 3.19.** Let P be some property of derivations w.r.t. Term Rewriting Systems.

1- A Term Rewriting System  $(\mathcal{R}, \mathcal{F})$  is called P if for every  $s, t \in \mathcal{T}(\mathcal{F})$  such that  $s \to_{\mathcal{R}}^* t$  there exists a P-derivation from s to t.

2- A semi-Thue system (S, A) is called P if the Term Rewriting System  $(\mathcal{F}(S), \mathcal{F}(A))$  is called P.

We shall use the convention that, for a property P denoted by a lower-case acronym for derivations, we use the same acronym, but in upper-case, to denote the property P extended to systems by Definition 3.19. For example, a Term Rewriting System  $(\mathcal{R}, \mathcal{F})$  is called  $\mathsf{BU}(k)$  if for every  $s, t \in \mathcal{T}(\mathcal{F})$  such that  $s \to_{\mathcal{R}}^* t$  there exists a  $\mathsf{bu}(k)$ -derivation from s to t.

We denote by BU(k) the class of BU(k) systems, by  $BU^{-}(k)$  the class of  $BU^{-}(k)$  systems. We define the class of bottom-up systems, denoted BU, by:

$$\mathsf{BU} := \bigcup_{k \in \mathbb{N}} \mathsf{BU}(k)$$

**Lemma 3.20.** For every k > 0,  $BU(k-1) \subseteq BU^{-}(k) \subseteq BU(k)$ .

**Lemma 3.21.** Every right-ground system is BU(0).

*Proof.* The right-handsides being ground no mark (> 0) is ever introduced by  $\rightarrow$ .

**Lemma 3.22.** Every inverse of a left-basic semi-Thue system is BU<sup>-</sup>(1).

*Proof.* Let (S, A) be a semi-Thue system such that  $S^{-1}$  is left-basic. The combinatorial restrictions defining the property "left-basic" (see, for example, conditions C1,C2 of section 2.5 in [32]) imply that, in *every* marked wbuderivation

$$w\# \hookrightarrow_{\mathcal{F}(S)}^* \overline{\alpha u}\overline{\beta}\# \hookrightarrow_{\mathcal{F}(S)} \overline{\alpha v}\overline{\beta}\#,$$

 $<sup>^{1}</sup>$ a class of TRS is a subset of the set of all TRS (over a fixed denumerable ranked alphabet) which is closed under alphabet isomorphism (i.e. renaming the symbols).

with  $w \in A^*, u \to v \in S, \overline{\alpha}, \overline{\beta} \in (A^{\mathbb{N}})^*$ , we must have

$$\mathsf{mmax}(\overline{u}) = 0.$$

Hence  $\mathcal{F}(S) \in \mathsf{BU}^-(1)$ , so that, by point 2 of Definition 3.19,  $S \in \mathsf{BU}^-(1)$ .

**Lemma 3.23.** Every shallow system is BU<sup>-</sup>(1).

Proof. Let  $\mathcal{R}$  be a shallow set of rules. This implies that every rule  $l \to r \in \mathcal{R}$  is such that l is a variable or all the occurrences of variables in l have depth 1. Let us consider a wbu-derivation of the form (15) starting on some unmarked term s. Every marked term  $\bar{l}_i$  either has no mark (because it has depth 0) or has only one mark above each occurrence of variable: the mark of the root of  $\bar{l}_i$ . In this case  $\mathbf{m}(\bar{l}_i) = 0$ , by Definition 3.7 and because, by Lemma 3.14,  $\overline{C_i}[\bar{l}_i\overline{\sigma_i}]$  is m-increasing. Hence Definition 3.16 is fulfilled by the given derivation.

**Lemma 3.24.** Every growing linear system is BU(1).

*Proof.* Let  $\mathcal{R}$  be a linear growing system over a signature  $\mathcal{F}$  and  $s, t \in \mathcal{T}(\mathcal{F})$ . We prove by induction on the integer n that: if  $\overline{s_0} \hookrightarrow \ldots \hookrightarrow \overline{s_n}$  is a wbu marked derivation starting on an unmarked term  $\overline{s_0} \in \mathcal{T}(\mathcal{F})$ ,

$$\forall i \in [0, n], \ \operatorname{mmax}(\overline{s_i}) \le 1.$$

**Basis**: n = 0. Then  $mmax(\overline{s_0}) = 0$  (by hypothesis).

**Induction step**: Suppose that

$$\overline{s_0} \hookrightarrow \ldots \hookrightarrow \overline{s_{n+1}}$$

with  $\overline{s_0} \in \mathcal{T}(\mathcal{F})$ . By induction hypothesis,  $\forall i \in [0, n], \mathsf{mmax}(\overline{s_i}) \leq 1$ .

$$\overline{s_n} = \overline{C_n} [\overline{l_n} \overline{\sigma_n}]_{v_n} \hookrightarrow \overline{C_n} [r_n \overline{\overline{\sigma_n}}]_{v_n} = \overline{s_{n+1}}$$

From  $\max(\overline{s_n}) \leq 1$ , we get  $\max(\overline{C_n}) \leq 1$  and  $\forall x \in \mathcal{V}ar(l_n), \max(x\overline{\sigma_n}) \leq 1$ .

We also have  $mmax(r_n) = 0$ .

If  $Var(r_n) = \emptyset$  then  $\overline{s_{n+1}} = \overline{C_n}[r_n]$  and  $mmax(s_{n+1}) \le 1$ .

Let us assume now that  $Var(r_n) \neq \emptyset$ .

Since  $\mathcal{R}$  is growing, x is at depth 0 or 1 in  $l_n$ . Since the derivation is wbu,  $\mathsf{m}(\bar{l}_n) = 0$ . By Lemma 3.14, for every position v of  $\overline{s_n}$ ,

$$v \leq v_n \Rightarrow \mathbf{m}(v) = 0$$

It follows that

$$\mathsf{M}(\bar{C}_n[\bar{l}_n], x) \leq 1$$

By definition of relation  $\hookrightarrow$ 

$$x\overline{\overline{\sigma_n}} := (x\overline{\sigma_n}) \odot M(\overline{C_n}[\overline{l_n}], x)$$

where both  $\max(x\overline{\sigma_n}) \leq 1$  and  $M(\overline{C_n}[\overline{l_n}], x) \leq 1$ . Hence

$$\operatorname{mmax}(x\overline{\overline{\sigma_n}}) \le 1.$$

Finally, all the marks whether in  $\overline{C_n}$  or in  $r_n$  or in  $x\overline{\overline{\sigma_n}}$  (for  $x \in \mathcal{V}ar(r_n)$ ) are bounded by 1, hence  $mmax(\overline{s_{n+1}}) \leq 1$ .

## Example 3.25.

The system  $\mathcal{R}_0 = \{f(f(x)) \to f(x)\} \in \mathsf{BU}^-(1) \text{ and } \mathcal{R}_0 \text{ is not growing.}$ 

The system  $\mathcal{R}_1$  of Example 3.1 belongs to  $\mathsf{BU}^-(2)$  and  $\mathcal{R}_1$  is not growing.

The system  $\mathcal{R}_2 = \{f(x) \to g(x), h(g(a)) \to a\}$  is growing and belongs to  $BU^-(1)$ .

The system  $\mathcal{R}_3 = \{f(x) \to g(x), g(h(x)) \to a\}$  is growing and belongs to BU(1).

Corollary 3.26. LinearGrowing  $\subseteq BU(1)$ .

#### 4. Inverse-preservation of recognizability

Let us recall the following classical result about ground rewriting systems

**Theorem 4.1** ([6]). Every ground system is inverse-recognizability preserving.

This theorem was further refined and extended in [11, 10, 9], see [7] for an exposition. The main theorem of this section (and of the paper) is the following extension of Theorem 4.1 to  $\mathsf{bu}(k)$  derivations of linear rewriting systems

**Theorem 4.2.** Let  $\mathcal{R}$  be some linear rewriting system over the signature  $\mathcal{F}$ , let T be some recognizable subset of  $\mathcal{T}(\mathcal{F})$  and let  $k \geq 0$ . Then, the set  $(\begin{substance} k \to \mathcal{R} \end{substance})[T]$  is recognizable too.

### 4.1. Basic construction

In order to prove Theorem 4.2 we have to introduce some technical definitions, and to prove some technical lemmas. Let us fix, from now on and until the end of the subsection, a linear system  $(\mathcal{R}, \mathcal{F})$ , a language  $T \subseteq \mathcal{T}(\mathcal{F})$  recognized by a finite automaton over the extended signature  $\mathcal{F} \cup \{\Box\}$ ,  $\mathcal{A} = (\mathcal{F} \cup \{\Box\}, Q, Q_f, \Gamma)$  and an integer  $k \geq 0$ . In order to make the proofs easier, we assume in this subsection that:

$$\forall l \to r \in \mathcal{R}, l \notin \mathcal{V}, \tag{23}$$

$$\mathcal{A}$$
 is standard. (24)

We postpone to §4.2 the proof that these restrictions are not a loss of generality. Let us define the integer

$$d := \max\{dpt(l) \mid l \to r \in \mathcal{R}\}. \tag{25}$$

**Example 4.3.** For the system  $\mathcal{R}_1$  of example 3.1, d = 2.

We introduce now a notion of top part of a term  $\overline{t}$ , which is, intuitively, the only part of  $\overline{t}$  which can be used in a  $\mathsf{bu}(k)$ -derivation starting on  $\overline{t}$ . Everything below this part is merely included in the substitutions used by the derivation-steps, and thus copied (eq.(25) and Def.4.4 are tuned for this property). Such copied parts of  $\overline{t}$  can be handled just by a state of the f.t.a.  $\mathcal{A}$ . The replacement of terms by their top-part will be used subsequently to show that the full derivations w.r.t  $k \to_{\mathcal{R}}^*$  can be simulated by derivations w.r.t some "approximating" ground rewriting system (introduced by Def. 4.10): the top-part of a real derivation is a derivation for the ground rewriting system (Lemma 4.18) and, conversely, every derivation for the ground rewriting system is the top-part of some real derivation (Lemma 4.11).

We define, at first, the *top domain* of a term and, later on, the top of a term.

**Definition 4.4** (Top domain of a term). Let  $\overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k}, \{\Box\})$ . We define the top domain of  $\overline{t}$ , denoted by  $\mathsf{Topd}(\overline{t})$  as:  $u \in \mathsf{Topd}(\overline{t})$  iff 1-  $u \in \mathcal{P}\mathsf{os}(\overline{t})$  2-  $\forall u_1, u_2 \in \mathbb{N}^*$  such that  $u = u_1 \cdot u_2$ , either  $\mathsf{m}(\overline{t}/u_1) = 0$  or  $|u_2| \leq (k+1-1)$ 

2-  $\forall u_1, u_2 \in \mathbb{N}^*$  such that  $u = u_1 \cdot u_2$ , either  $\mathbf{m}(t/u_1) = 0$  or  $|u_2| \le (k+1-\mathbf{m}(\overline{t}/u_1))\mathbf{d}$ .

**Lemma 4.5.** For every  $\overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k}, \{\Box\})$ ,  $\mathsf{Topd}(\overline{t})$  is a subdomain of  $\mathcal{P}\mathsf{os}(\overline{t})$ .

*Proof.* 1- Let  $u \in \mathsf{Topd}(\overline{t})$  and let  $v \leq u$ . Let  $w \in \mathbb{N}^*$  such that  $v \cdot w = u$ . Suppose that  $v = v_1 \cdot v_2$  and that  $\mathsf{m}(\overline{t}/v_1) \neq 0$ .

Since  $u = v_1 \cdot v_2 \cdot w$  and u belongs to  $\mathsf{Topd}(\overline{t})$ , the inequality  $|v_2w| \leq (k+1-\mathsf{m}(\overline{t}/u_1))\mathsf{d}$  holds. But  $|v_2| \leq |v_2w|$ , hence

$$|v_2| \leq (k+1-\mathsf{m}(\overline{t}/u_1))\mathsf{d}.$$

2- Let  $u \in \mathbb{N}^*$  and  $i, j \in \mathbb{N}$  such that  $u \cdot i \in \mathsf{Topd}(\overline{t})$  and  $u \cdot j \in \mathcal{P}\mathsf{os}(\overline{t})$ . Suppose  $u_1, u_2 \in \mathbb{N}^*$  such that  $u \cdot j = u_1 \cdot u_2$ :

- If  $u_2 \neq \varepsilon$ , since  $u \cdot i = u_1 \cdot u_2'$ , where  $u_2' := u_2(j)^{-1}i$ , we know that:

$$m(\overline{t}/u_1) = 0 \text{ or } |u_2'| \le (k+1-m(\overline{t}/u_1))d.$$

which implies, since  $|u_2| = |u_2'|$  that:

$$\mathsf{m}(\overline{t}/u_1) = 0 \text{ or } |u_2| \le (k+1-\mathsf{m}(\overline{t}/u_1))\mathsf{d}.$$

- If  $u_2 = \varepsilon$  the required inequality for  $|u_2|$  is obvious.

**Definition 4.6** (Top of a term). For every  $\overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k}, \{\Box\})$ ,  $\mathsf{Top}(\overline{t}) = \mathsf{Red}(\overline{t}, \mathsf{Topd}(\overline{t}))$ .

Note that, since  $\mathsf{Topd}(\overline{t})$  is a subdomain of  $\mathcal{P}\mathsf{os}(\overline{t})$  and is written over the alphabet of the standard automaton  $\mathcal{A}$ ,  $\mathsf{Top}(\overline{t})$  is well-defined. This definition extends naturally, in a pointwise manner, to substitutions.

**Lemma 4.7** (Top is morphic). Let  $\overline{C}[]$  be a context with no mark above the symbol  $\square$  and let  $\overline{t}$  be any marked term in  $\mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$ . Then  $\mathsf{Top}(\overline{C}[\overline{t}]) = \mathsf{Top}(\overline{C})[\mathsf{Top}(\overline{t})]$ .

The proof is easy and therefore omitted.

**Lemma 4.8** (Top preserves unmarked terms). If  $t \in \mathcal{T}(\mathcal{F} \cup Q, \mathcal{V})$  and  $\overline{\sigma} : \mathcal{V} \to \mathcal{T}((\mathcal{F} \cup Q))^{\mathbb{N}}$  then  $\mathsf{Top}(t\overline{\sigma}) = t\mathsf{Top}(\overline{\sigma})$ .

*Proof.* The proof is easy and therefore omitted.  $\Box$ 

**Lemma 4.9** (Top is decreasing). Let  $\overline{s}, \overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}})$  be such that  $\mathcal{P}os(\overline{s}) = \mathcal{P}os(\overline{t})$  and, such that, for every  $u \in \mathcal{P}os(\overline{s})$ ,  $\mathsf{m}(\overline{s}/u) \leq \mathsf{m}(\overline{t}/u)$ . Then  $\mathcal{P}os(\mathsf{Top}(\overline{s})) \supseteq \mathcal{P}os(\mathsf{Top}(\overline{t}))$ .

**Definition 4.10.** We consider the following ground rewriting system S over  $\mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  consisting of all the rules of the form:

$$\overline{l}\overline{\tau} \to r\overline{\overline{\tau}}$$
 (26)

where  $l \to r$  is a rule of  $\mathcal{R}$ 

$$\mathsf{m}(\overline{l}) = 0 \tag{27}$$

and  $\overline{\tau}: \mathcal{V} \to \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  is a marked substitution such that,  $\forall x \in \mathcal{V}ar(l)$ 

$$x\overline{\overline{\tau}} = x\overline{\tau} \odot M(\overline{l}, x), \quad dpt(x\overline{\tau}) \le k \cdot \mathsf{d}.$$
 (28)

(recall that the number d was defined by (25)).

Lemma 4.11 (lifting  $S \cup A$  to R).

Let  $\overline{s}, \overline{s'}, \overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that  $\overline{s'}$  is m-increasing. If  $\overline{s'} \to_{\mathcal{A}}^* \overline{s}$  and  $\overline{s} \to_{\mathcal{S} \cup \mathcal{A}}^* \overline{t}$  then, there exists a term  $\overline{t'} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that  $\overline{s'}_{k} \odot_{\mathcal{R}}^* \overline{t'}$  and  $\overline{t'} \to_{\mathcal{A}}^* \overline{t}$ .

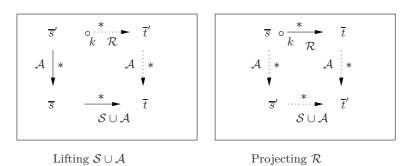

Figure 4: Lemma 4.11 and 4.18

*Proof.* 1- Let us prove that the lemma holds for  $\overline{s} \to_{\mathcal{S} \cup \mathcal{A}} \overline{t}$ . Let us suppose that  $\overline{s}' \to_{\mathcal{A}}^* \overline{s} \to_{\mathcal{A}} \overline{t}$ . Let us then choose  $\overline{t}' := \overline{s}'$ . It satisfies:  $\overline{s}' \ _k \circ \to_{\mathcal{R}}^0 \overline{t}'$  and  $\overline{t}' = \overline{s}' \to_{\mathcal{A}}^* \overline{s} \to_{\mathcal{A}} \overline{t}$ . Hence the conclusion of the lemma holds. Suppose now that  $\overline{s} \to_{\mathcal{S}} \overline{t}$ . This means that

$$\overline{s} = \overline{C}[\overline{l}\overline{\tau}], \ \overline{t} = \overline{C}[r\overline{\overline{\tau}}]$$

for some rule  $l \to r \in \mathcal{R}$ , marked context  $\overline{C}$ , and marked substitution  $\overline{\tau}$ , satisfying (27-28).

Since  $\overline{s}' \to_{\mathcal{A}}^* \overline{s}$  it must have the form

$$\overline{s}' = \overline{C}[\overline{l}\overline{\tau}']$$

where, for every  $x \in \mathcal{V}ar(l)$ ,  $x\overline{\tau}' \to_{\mathcal{A}}^* x\overline{\tau}$ . Let us set

$$x\overline{\overline{\tau}}' := x\overline{\tau}' \odot M(\overline{l}, x), \ \overline{t}' := \overline{C}[r\overline{\overline{\tau}}'].$$

Since  $\overline{s'}$  is m-increasing,  $M(\overline{l},x)=M(C[\overline{l}],x)$ . Hence, by definition of  $\hookrightarrow$ ,  $\overline{s'} \hookrightarrow_{\mathcal{R}} \overline{t'}$  and by condition (27) this step is wbu, i.e.

$$\overline{s}'_{k} \hookrightarrow_{\mathcal{R}} \overline{t}'.$$

By Lemma 3.5, for every x,

$$x\overline{\overline{\tau}}' = x\overline{\tau}' \odot M(\overline{l}, x) \to_{\mathcal{A}}^* x\overline{\tau} \odot M(\overline{l}, x) = x\overline{\overline{\tau}}.$$

Hence  $\overline{t}' = \overline{C}[r\overline{\overline{\tau}}'] \to_{\mathcal{A}}^* \overline{C}[r\overline{\overline{\tau}}] = \overline{t}$ .

2- Let us prove, by induction over the integer  $n \geq 0$ , the statement

$$\forall n \in \mathbb{N}, \forall \overline{s}, \overline{s'}, \overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$$

 $(\overline{s'} \text{ m-increasing \& } \overline{s'} \to_{\mathcal{A}}^* \overline{s} \& \overline{s} \to_{\mathcal{S} \cup \mathcal{A}}^n \overline{t}) \Rightarrow \exists \overline{t'}, (\overline{s'}_k \circ \to_{\mathcal{R}}^* \overline{t'} \& \overline{t'} \to_{\mathcal{A}}^* \overline{t}).$  (29)

(here  $\overline{t'}$  is implicitly quantified over  $\mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$ ).

Basis: n = 0.

In this case  $\overline{s}' = \overline{s}$ . Choosing  $\overline{t'} := \overline{t}$ , the conclusion of implication (29) holds. **Induction step**: n > 1.

Let us suppose that the hypothesis of implication (29) holds. There exists a term  $\hat{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that

$$\overline{s} \to_{S \cup A}^{n-1} \hat{t} \to_{S \cup A}^{1} \overline{t}.$$

By induction hypothesis, there exists some  $\hat{t}' \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that

$$\overline{s}'_{k} \circ \to_{\mathcal{R}}^{*} \hat{t}' \& \hat{t}' \to_{\mathcal{A}}^{*} \hat{t}.$$
 (30)

By Lemma 3.14  $\hat{t}'$  is m-increasing and by point 1 of this proof, there exists some  $\overline{t'} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that

$$\hat{t'}_{k} \hookrightarrow_{\mathcal{R}}^{*} \overline{t'} \& \overline{t'} \to_{\mathcal{A}}^{*} \overline{t}. \tag{31}$$

Putting together statements (30) and (31), we obtain the conclusion of implication (29).  $\Box$ 

**Remark 4.12.** The assumption that A is standard (24) is not used in the above proof. Hence Lemma 4.11 also holds without this restriction.

**Lemma 4.13** (projecting one step of  $\mathcal{R}$  on  $\mathcal{S} \cup \mathcal{A}$ ).

Let  $\overline{s}, \overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that:

 $1 - \overline{s} \hookrightarrow_{\mathcal{R}} \overline{t},$ 

2- The marked rule  $(\bar{l},r)$  used in the above rewriting-step is such that  $\mathbf{m}(\bar{l})=0$ .

3- $\overline{s}$  is m-increasing.

Then,  $\mathsf{Top}(\overline{s}) \to_{\mathcal{A}}^* \to_{\mathcal{S}} \mathsf{Top}(\overline{t})$ .

*Proof.* Let us assume hypotheses (1,2,3) of Lemma 4.13. In particular:

$$\overline{s} = \overline{C}[\overline{l}\overline{\sigma}], \ \overline{t} = \overline{C}[r\overline{\overline{\sigma}}]$$

for some  $\overline{C}, \overline{\sigma}, \overline{l}, r, \overline{\overline{\sigma}}$  fulfilling (12-14) and  $\mathbf{m}(\overline{l}) = 0$ . Let us then define a context  $\overline{D}$  and marked substitutions  $\overline{\tau}, \overline{\overline{\tau}}$  by:

$$\overline{D}[] = \mathsf{Top}(\overline{C}[]). \tag{32}$$

$$\forall x \in \mathcal{V}, \ x\overline{\overline{\tau}} = \mathsf{Top}(x\overline{\overline{\sigma}}), \ x\overline{\tau} = \mathsf{Red}(x\overline{\sigma}, \mathcal{P}\mathsf{os}(x\overline{\overline{\tau}})). \tag{33}$$

We claim that

$$\operatorname{Top}(\overline{s}) \to_{\mathcal{A}}^* \overline{D}[\overline{l}\overline{\tau}] \to_{\mathcal{S}} \overline{D}[r\overline{\overline{\tau}}] = \operatorname{Top}(\overline{t}). \tag{34}$$

We cut into four facts the detailed verification of this claim.

Fact 4.14.  $\mathcal{P}os(\overline{l}\mathsf{Top}(\overline{\overline{\sigma}})) \subseteq \mathcal{P}os(\mathsf{Top}(\overline{l}\overline{\overline{\sigma}})).$ 

Let  $u \in \mathcal{P}os(\overline{l}Top(\overline{\overline{\sigma}}))$ .

Case 1:  $u \in \mathcal{P}os_{\overline{\mathcal{V}}}(\overline{l})$ .

In this case  $|u| \leq d$ . Hence, for every factorization  $u = u_1 \cdot u_2$ , since  $m(\overline{t}/u_1) \leq k$ ,

$$|u_2| \le |u| \le \mathsf{d} \le (k+1-\mathsf{m}(\overline{t}/u_1))\mathsf{d}.$$

Case 2:

$$u = v \cdot w$$

for some  $x \in \mathcal{V}ar(l)$ ,  $v = pos(\overline{l}, x)$ ,  $w \in Topd(x\overline{\overline{\sigma}})$ . Let us consider any decomposition  $u = u_1 \cdot u_2$  and show it fulfils condition (2) of Definition 4.4. We use the notation

$$m_1 = \mathbf{m}(\overline{l}\overline{\overline{\sigma}}/u_1), \ \ m = \mathbf{m}(\overline{l}\overline{\overline{\sigma}}/f)$$

where f is the father of v. If  $m_1 = 0$  this condition (2) is clearly true. Let us assume that  $m_1 \ge 1$ .

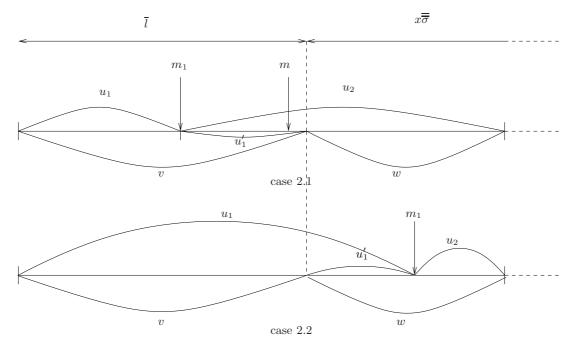

Figure 5: Fact 4.14

# Case 2.1: $u_1 \leq v$ .

In this case there exists  $u_1'$  such that

$$v = u_1 u_1', \quad u_2 = u_1' w, \quad |u_1'| \ge 0.$$

As  $w \in \mathsf{Topd}(x\overline{\overline{\sigma}})$ ,

$$|w| \le (k + 1 - \mathsf{m}(x\overline{\overline{\sigma}}))\mathsf{d} \tag{35}$$

but  $\mathbf{m}(x\overline{\overline{\sigma}}) \ge M(\overline{l}, x) = m + 1$ , hence

$$|w| \le (k+1-m-1)d.$$
 (36)

Using the fact that  $|u_1'| \leq dpt(\overline{l}) \leq \mathsf{d}$  we obtain that

$$|u_1'w| \le (k+1-m-1)d + d = (k+1-m)d$$
 (37)

and, since the marks increase from top to leaves,  $m \geq m_1$ , so that

$$|u_1'w| \le (k+1-m_1)\mathsf{d} \tag{38}$$

which can be reformulated as

$$|u_2| \le (k+1 - \mathsf{m}(\overline{l}\overline{\overline{\sigma}}/u_1))\mathsf{d}. \tag{39}$$

Case 2.2:  $v \prec u_1$ .

In this case there exists  $u'_1$  such that

$$u_1 = vu_1', \ u_1'u_2 = w, \ |u_1'| \ge 1.$$

As  $w \in \mathsf{Topd}(x\overline{\overline{\sigma}})$ 

$$|u_2| \le (k+1 - \mathsf{m}(x\overline{\overline{\sigma}}/u_1'))\mathsf{d} \tag{40}$$

which can be rewritten

$$|u_2| \le (k+1-\mathsf{m}(\overline{l}\overline{\overline{\sigma}}/u_1))\mathsf{d}.$$
 (41)

Since in all cases condition (2) of Definition 4.4 is fulfilled, Fact 4.14 is established.

Fact 4.15.  $\operatorname{Top}(\overline{l}\overline{\sigma}) \to_{\mathcal{A}}^* \overline{l}\overline{\tau}$ .

We know that

$$\overline{l}\overline{\sigma} \to_{\mathcal{A}}^* \mathsf{Top}(\overline{l}\overline{\sigma}) \tag{42}$$

(by definition of Top) and that

$$\overline{l}\overline{\sigma} \to_{\mathcal{A}}^* \overline{l}\overline{\tau} \tag{43}$$

because, by (33), every  $x\overline{\tau}$  is a reduct of the corresponding  $x\overline{\sigma}$ . Moreover, by Fact 4.14,

$$\mathcal{P}\mathsf{os}(\overline{l}\overline{\tau}) = \mathcal{P}\mathsf{os}(\overline{l}\mathsf{Top}(\overline{\overline{\sigma}})) \subseteq \mathcal{P}\mathsf{os}(\mathsf{Top}(\overline{l}\overline{\overline{\sigma}})),$$

and by Lemma 4.9  $\mathcal{P}os(\mathsf{Top}(\overline{l}\overline{\overline{\sigma}})) \subseteq \mathcal{P}os(\mathsf{Top}(\overline{l}\overline{\sigma}))$ , so that

$$\mathcal{P}os(\overline{l}\overline{\tau}) \subseteq \mathcal{P}os(\mathsf{Top}(\overline{l}\overline{\sigma})).$$
 (44)

Lemma 2.8 applied to (42-44) shows that  $\mathsf{Top}(\overline{l}\overline{\sigma}) \to_{\mathcal{A}}^* \overline{l}\overline{\tau}$ .

Fact 4.16.  $\overline{D}[\overline{l}\overline{\tau}] \to_{\mathcal{S}} \overline{D}[r\overline{\overline{\tau}}]$ .

By hypothesis (2) of the lemma,  $m(\bar{l}) = 0$ . By the general assumption (23) and hypothesis (3) of the lemma,

$$\forall x \in \mathcal{V}ar(l), \ \mathsf{M}(\overline{l}, x) = \mathsf{M}(\overline{C}[\overline{l}], x),$$

hence

$$x\overline{\overline{\tau}} := x\overline{\tau} \odot \mathsf{M}(\overline{l}, x).$$

Moreover,  $dpt(x\overline{\tau}) \leq (k+1-\mathsf{M}(\overline{l},x)) \cdot \mathsf{d} \leq k \cdot \mathsf{d}$ , since  $\mathsf{M}(\overline{l},x) \geq 1$ . Hence  $\overline{l}\overline{\tau} \to r\overline{\overline{\tau}}$  is a rule of  $\mathcal{S}$ .

Fact 4.17. 
$$\overline{D}[r\overline{\overline{\tau}}] = \mathsf{Top}(\overline{t}).$$

This fact follows from Lemma 4.7 and Lemma 4.8. Using these facts we obtain that

$$\begin{array}{ll} \operatorname{\mathsf{Top}}(\overline{s}) &= \overline{D}[\operatorname{\mathsf{Top}}(\overline{l}\overline{\sigma})] & \text{(by Lemma 3.12 and Lemma 4.7)} \\ \overline{D}[\operatorname{\mathsf{Top}}(\overline{l}\overline{\sigma})] &\to_{\mathcal{A}}^* \overline{D}[\overline{l}\overline{\tau}] & \text{(by Fact 4.15)} \\ \overline{D}[\overline{l}\overline{\tau}] &\to_{\mathcal{S}} \overline{D}[r\overline{\overline{\tau}}] & \text{(by Fact 4.16)} \\ \overline{D}[r\overline{\overline{\tau}}] &= \operatorname{\mathsf{Top}}(\overline{t}) & \text{(by Fact 4.17)}. \end{array}$$

Thus claim (34) is verified, which proves the lemma.

**Lemma 4.18** (projecting  $\mathcal{R}$  on  $\mathcal{S} \cup \mathcal{A}$ ).

Let  $\overline{s}, \overline{t} \in \mathcal{T}(\mathcal{F}^{\leq k})$  and assume that  $\overline{s}$  is m-increasing. If  $\overline{s}_k \circ \to_{\mathcal{R}}^* \overline{t}$  then, there exist terms  $\overline{s}', \overline{t}' \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that

$$\overline{s} \to_{\mathcal{A}}^* \overline{s}' \to_{\mathcal{S} \cup \mathcal{A}}^* \overline{t}'$$
 and  $\overline{t} \to_{\mathcal{A}}^* \overline{t}'$ .

*Proof.* The marked derivation  $\overline{s} \circ \to_{\mathcal{R}}^* \overline{t}$  is wbu, hence it can be decomposed into n successive steps where the hypothesis 2 of Lemma 4.13 is valid. Hypothesis 3 of Lemma 4.13 will also hold, owing to our assumption and to Lemma 3.14. We can thus deduce, inductively, from the conclusion of Lemma 4.13, that  $\mathsf{Top}(\overline{s}) \to_{\mathcal{S} \cup \mathcal{A}}^* \mathsf{Top}(\overline{t})$ . The choice  $\overline{s}' := \mathsf{Top}(\overline{s}), \overline{t}' := \mathsf{Top}(\overline{t})$  fulfills the conclusion of the lemma.

**Lemma 4.19.** Let  $s \in \mathcal{T}(\mathcal{F})$ . Then  $s \mapsto_{\mathcal{R}}^* T$  iff  $s \to_{\mathcal{S} \cup \mathcal{A}}^* Q_f^{\leq k}$ .

Proof.

 $(\Rightarrow)$ : Suppose  $s \xrightarrow{k}^* t$  and  $t \in T$ . Let us consider the corresponding marked derivation

$$\overline{s}_{k} \circ \to_{\mathcal{R}}^{*} \overline{t}$$
 (45)

where  $\overline{s} := s$ . Derivation (45) is wbu and lies in  $\mathcal{T}(\mathcal{F}^{\leq k})$ . Let us consider the terms  $\overline{s}', \overline{t}'$  given by Lemma 4.18:

$$\overline{s} \to_{\mathcal{A}}^* \overline{s}' \to_{\mathcal{S} \cup \mathcal{A}}^* \overline{t}'$$
 (46)

and  $\overline{t} \to_{\mathcal{A}}^* \overline{t}'$ . Since  $\overline{t} \to_{\mathcal{A}}^* Q_f^{\leq k}$ , by Lemma 2.8,

$$\overline{t}' \to_{\mathcal{A}}^* Q_f^{\leq k}. \tag{47}$$

Combining (46) and (47) we obtain

$$s \to_{\mathcal{S} \cup \mathcal{A}}^* Q_f^{\leq k}$$
.

 $(\Leftarrow)$ : Suppose  $s \to_{\mathcal{S} \cup \mathcal{A}}^* q^j \in Q_f^{\leq k}$ .

The hypotheses of Lemma 4.11 are met by  $\overline{s} := s, \overline{s}' := s$  and  $\overline{t} := q^j$ . By Lemma 4.11 there exists some  $\overline{t}' \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that

$$\overline{s}_k \hookrightarrow_{\mathcal{R}}^* \overline{t'} \to_{\mathcal{A}}^* q^j \in Q_f^{\leq k}.$$

These derivations are mapped (by removal of the marks) into:

$$s \underset{k}{\rightarrow_{\mathcal{R}}} t' \xrightarrow{*}_{\mathcal{A}} q \in Q_f,$$

which shows that  $t' \in T$  hence that  $s \underset{\mathbb{R}}{\longrightarrow}_{\mathcal{R}} T$ .

We can now prove **Theorem 4.2**.

*Proof.* By Lemma 4.19,  $({}_k \to_{\mathcal{R}}^*)[T] = (\to_{\mathcal{S} \cup \mathcal{A}}^*)[Q_f^{\leq k}] \cap \mathcal{T}(\mathcal{F})$ . The rewriting systems  $\mathcal{S}$  and  $\mathcal{A}$  being ground are inverse-recognizability preserving (Theorem 4.1). So  $(\to_{\mathcal{S} \cup \mathcal{A}}^*)[Q_f^{\leq k}]$  is recognizable and thus  $({}_k \to_{\mathcal{R}}^*)[T]$  is recognizable.

Corollary 4.20. Every linear rewriting system of the class BU is inverse-recognizability preserving.

*Proof.* If 
$$\mathcal{R}$$
 belongs to  $\mathsf{BU}(k)$ , then  $(\to_{\mathcal{R}}^*)[T] = (_k \to_{\mathcal{R}}^*)[T]$ .

**Remark 4.21.** In the above proof of corollary 4.20 we could use the ground rewriting system  $S^0 \cup A$  over the signature F (recall that  $S^0$  is obtained from S by forgetting the marks): when R belongs to BU(k),

$$(\rightarrow_{\mathcal{R}}^*)[T] = (\rightarrow_{\mathcal{S}^0 \cup \mathcal{A}}^*)[Q_f] \cap \mathcal{T}(\mathcal{F}).$$

This also gives an effective way for computing a f.t.a recognizing  $(\rightarrow_{\mathcal{R}}^*)[T]$ .

**Example.** With  $\mathcal{R}_1$  of example 3.1 and  $\mathcal{A} = (\mathcal{F}, \{q_a\}, \{q_a\}, \{a \rightarrow q_a\})$  recognizing  $T = \{a\}$ , we obtain

$$\mathcal{S}^0 \supseteq \{\mathsf{a} \to q_\mathsf{a}\} \cup \{\mathsf{f}(q_\mathsf{a}) \to g(q_\mathsf{a}), g(h(q_\mathsf{a})) \to \mathsf{i}(q_\mathsf{a}), \mathsf{i}(q_\mathsf{a}) \to \mathsf{a}\}$$

**Example.** The derivation  $f(h(f(h(a)))) \hookrightarrow^* a$  given in Example 3.6 may be simulated by  $S^0$ :

$$\begin{array}{l} f(h(f(h(a)))) \rightarrow_{\mathcal{S}^0} f(h(f(h(q_a)))) \rightarrow_{\mathcal{S}^0} f(h(g(h(q_a)))) \rightarrow_{\mathcal{S}^0} \\ f(h(i(q_a))) \rightarrow_{\mathcal{S}^0} f(h(q_a)) \rightarrow_{\mathcal{S}^0} g(h(q_a)) \rightarrow_{\mathcal{S}^0} i(q_a) \rightarrow a \end{array}$$

#### 4.2. General construction

We show here that Theorem 4.2 still holds when the restrictions (23-24) are removed.

### 4.2.1. Allowing variable lhs

Let  $\mathcal{R}$  be some left-linear finite rewriting system over the signature  $\mathcal{F}$ . We show here how to reduce the properties of this TRS  $\mathcal{R}$  to properties of a TRS which has no variable left-handside nor any variable right-handside (this reduction is borrowed from [34]).

Let us introduce a new unary symbol  $\#_1 \notin \mathcal{F}$  and consider the signature  $\mathcal{F}_1 := \mathcal{F} \cup \{\#_1\}$ . We consider the map  $E_1 : \mathcal{T}(\mathcal{F}, \mathcal{V}) \to \mathcal{T}(\mathcal{F}_1, \mathcal{V})$  defined inductively by:

$$\forall v \in \mathcal{V}, E_1(v) = v, \forall a \in \mathcal{F}_0, E_1(a) = \#_1(a),$$

$$\forall n \geq 1, \forall f \in \mathcal{F}_n, \forall t_1, \dots, t_n \in \mathcal{T}(\mathcal{F}, \mathcal{V}), E_1(f(t_1, \dots, t_n)) = \#_1(f(E_1(t_1), \dots, E_1(t_n))).$$

It is clear that  $E_1$  is an injective map and, since  $E_1$  is a term-homorphism, for every subset  $T \subseteq \mathcal{T}(\mathcal{F}, \mathcal{V})$ , T is recognizable if and only if  $E_1(T)$  is recognizable. We define a new TRS

$$\mathcal{R}_1 := \{ E_1(l) \to E_1(r) \mid l \to r \in \mathcal{R} \}.$$

The system  $\mathcal{R}_1$  is a left-linear finite rewriting system over the signature  $\mathcal{F}_1$  and every rule  $(l_1, r_1) \in \mathcal{R}_1$  is such that  $l_1 \notin \mathcal{V}, r_1 \notin \mathcal{V}$ .

**Lemma 4.22** ( $\mathcal{R}$  embeddable in  $\mathcal{R}_1$ ). For every  $s, t \in \mathcal{T}(\mathcal{F})$  and integer  $k \geq 0$ ,

1- 
$$s \to_{\mathcal{R}}^* t \Leftrightarrow E_1(s) \to_{\mathcal{R}_1}^* E_1(t)$$
  
2-  $s \underset{k \to_{\mathcal{R}}^*}{\longrightarrow} t \Leftrightarrow E_1(s) \underset{k \to_{\mathcal{R}_1}}{\longrightarrow} E_1(t)$ 

In particular:  $s \xrightarrow{*}_{\mathcal{R}} T \Leftrightarrow E_1(s) \xrightarrow{*}_{\mathcal{R}_1} E_1(T)$  and  $\mathcal{R}$  is  $\mathsf{BU}(k)$  iff  $\mathcal{R}_1$  is  $\mathsf{BU}(k)$ . Hence Theorem 4.2 and Corollary 4.20 still hold, without assuming (23).

#### 4.2.2. Allowing non-deterministic automata

Let  $\mathcal{R}$  be some left-linear finite rewriting system over the signature  $\mathcal{F}$  fulfilling restriction (23) and let  $\mathcal{A} = (\mathcal{F}, Q, Q_f, \Gamma)$  be some f.t.a recognizing a language T (this f.t.a is not assumed standard, nor merely deterministic).

Automaton  $\hat{\mathcal{A}}$ . Let us define  $\hat{\mathcal{A}} := (\mathcal{F}, \mathcal{F}_0 \cup \hat{Q}, \mathcal{F}_{0,f} \cup \hat{Q}_f, \hat{\Gamma})$  by:

$$\hat{Q} := \mathcal{P}(Q)$$

$$\mathcal{F}_{0,f} := \{a \in \mathcal{F}_0 \mid a \in L(\mathcal{A})\}$$

$$\hat{Q}_f := \{P \in \hat{Q} \mid P \cap Q_f \neq \emptyset\}$$

$$\hat{\Gamma} := \{f(P_1, \dots, P_m) \to P \mid m \geq 1, f \in \mathcal{F}_m, P_1, \dots, P_m \in \mathcal{F}_0 \cup \hat{Q}, P = Q \cap [f(P_1, \dots, P_m)](\to^*_{\mathcal{A}})\}.$$

Some precisions about our notation:

- in the last definition the  $P_i$  which are equal to an element  $a_i \in \mathcal{F}_0$  are identified with the singleton  $\{a_i\}$  in the notation  $[f(P_1, \ldots, P_m)](\rightarrow_{\mathcal{A}}^*)$ .
- with this convention,  $f(P_1, \ldots, P_m)$  denotes the set  $\{f(p_1, \ldots, p_m) \mid p_1 \in P_1, \ldots, p_m \in P_m\}$ .
- $[f(P_1, \ldots, P_m)](\to_{\mathcal{A}}^*)$  denotes the set of descendants of  $f(P_1, \ldots, P_m)$ , as defined in equality (3).

Note that this construction of  $\hat{\mathcal{A}}$  from  $\mathcal{A}$  is just a slight variant of the usual powerset-construction. We still denote by  $\mathcal{S}$  the system deduced from  $\mathcal{R}$  and  $\mathcal{A}$  along Definition 4.10; we denote by  $\hat{\mathcal{S}}$  the system deduced from  $\mathcal{R}$  and  $\hat{\mathcal{A}}$  along Definition 4.10. We shall show that the structures  $(\mathcal{T}(\mathcal{F} \cup Q), \to_{\mathcal{S} \cup \mathcal{A}})$  and  $(\mathcal{T}(\mathcal{F} \cup \hat{Q}), \to_{\hat{\mathcal{S}} \cup \hat{\mathcal{A}}})$  are very close to each other. A precise formulation will be given in terms of *simulation* (see Definition 2.1).

**Lemma 4.23.** For every  $f.t.a \ \mathcal{A}$ , the  $f.t.a \ \hat{\mathcal{A}}$  is standard.

This lemma follows immediately from the above definition.

Simulations for  $\mathcal{A}$  and  $\hat{\mathcal{A}}$ . We define a binary relation  $\approx \subseteq (\mathcal{F}_0 \cup Q \cup \mathcal{V}) \times (\mathcal{F}_0 \cup \hat{Q} \cup \mathcal{V})$  by:

$$\approx := \{(a, a) \mid a \in \mathcal{F}_0\} \cup \{(v, v) \mid v \in \mathcal{V}\} \cup \{(p, P) \mid p \in P, P \in \hat{Q}\}$$

$$\cup \{(q, a) \mid q \in Q, a \in \mathcal{F}_0, a \to_{\mathcal{A}}^* q\}.$$

We extend  $\approx$  into the binary relation  $\sim \subseteq \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}) \times \mathcal{T}((\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V})$  defined as follows

**Definition 4.24.** For every  $\bar{t}, \hat{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}) \times \mathcal{T}((\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V}), \ \bar{t} \sim \hat{t}$  if and only if

1-  $\mathcal{P}$ os $(\bar{t}) = \mathcal{P}$ os $(\hat{t})$ 

 $2 - \forall u \in \mathcal{I} \mathbf{n}(\bar{t}), \bar{t}(u) = \hat{t}(u)$ 

3-  $\forall u \in \mathcal{L}v(\bar{t}), m(\bar{t}/u) = m(\hat{t}/u) \& \bar{t}^0(u) \approx \hat{t}^0(u).$ 

### Lemma 4.25.

1-  $\sim$  is a simulation of  $(\mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \rightarrow_{\mathcal{S}})$  by  $((\mathcal{T}(\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V}), \rightarrow_{\hat{\mathcal{S}}})$ . 2-  $\sim^{-1}$  is a simulation of  $(\mathcal{T}((\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V}), \leftarrow_{\hat{\mathcal{S}}})$  by  $(\mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \leftarrow_{\mathcal{S}})$ .

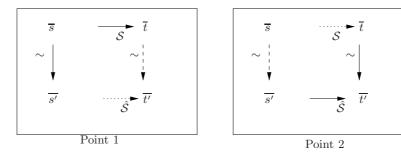

Figure 6: Lemma 4.25

Proof.

**Point 1** Let us suppose that  $\bar{s}, \bar{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \overline{s'} \in (\mathcal{T}(\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V})$  are such that  $\bar{s} \sim \overline{s'}$  and  $\bar{s} \to_{\mathcal{S}} \bar{t}$ .

Thus

$$\overline{s} = \overline{C}[\overline{l}\overline{\tau}], \ \overline{t} = \overline{C}[r\overline{\overline{\tau}}]$$

for some context  $\overline{C}[]$ , rule  $l \to r \in \mathcal{R}$  and substitutions  $\overline{\tau}, \overline{\overline{\tau}}$  fulfilling (28). By Definition 4.24 the term  $\overline{s'}$  has the form

$$\overline{s'} = \overline{C'} [\overline{l'} \overline{\tau'}]$$

with

$$\bar{l} \sim \bar{l'},$$
 (48)

$$\bar{C} \sim \overline{C'},$$
 (49)

$$\forall x \in \mathcal{V}ar(l), x\bar{\tau} \sim x\overline{\tau'}. \tag{50}$$

Every label of a leaf of  $\bar{l}$  belongs to  $\mathcal{F}_0^{\mathbb{N}} \cup \mathcal{V}$ . Relation (48) thus implies that  $\bar{l} = \bar{l'}$ , hence that

$$l' \to r \in \mathcal{R}.$$
 (51)

Let us define

$$\overline{t'} := \overline{C'}[r\overline{\overline{\tau'}}]$$

where the substitution  $\overline{\overline{\tau'}}$  is defined on every  $x \in \mathcal{V}ar(l)$  by

$$x\overline{\overline{\tau'}} := x\overline{\tau'} \odot M(\overline{l'}, x).$$

Relation (50) implies that, for every  $x \in \mathcal{V}ar(l)$ ,  $(x\overline{\tau}) \odot M(\overline{l}, x) \sim (x\overline{\tau'}) \odot M(\overline{l'}, x)$  i.e.

$$x\overline{\overline{\tau}} \sim x\overline{\overline{\tau'}}.$$
 (52)

Statement (51) shows that  $\overline{s'} \to_{\hat{S}} \overline{t'}$  while relations (49) and (52) show that  $\overline{t} \sim \overline{t'}$ . Point 1 of the lemma is thus proved.

#### Point 2

Let us suppose that  $\bar{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \bar{s'}, \bar{t'} \in (\mathcal{T}(\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V})$  are such that  $\bar{t} \sim \bar{t'}$  and  $\bar{s'} \to_{\hat{S}} \bar{t'}$ .

We know that

$$\overline{s'} = \overline{C'}[\overline{l}\overline{\tau'}], \ \overline{t'} = \overline{C'}[r\overline{\overline{\tau'}}]$$

for some context  $\overline{C'}[]$ , rule  $l \to r \in \mathcal{R}$  and substitutions  $\overline{\tau'}, \overline{\overline{\tau'}}$  fulfilling (28). Since  $\overline{t} \sim \overline{t'}$  we must have

$$\overline{t} = \overline{C}[r\overline{\overline{\tau}}]$$

for some  $\overline{C}[] \sim \overline{C'}[]$  and some substitution  $\overline{\overline{\tau}}$  fulfilling

$$\forall x \in \mathcal{V}ar(r), x\overline{\overline{\tau}} \sim x\overline{\overline{\tau'}}.$$
 (53)

Let us define

$$\overline{s} := \overline{C}[\overline{l}\overline{\sigma}] \tag{54}$$

where the substitution  $\overline{\sigma}$  is built in the following way:

$$\forall x \in \mathcal{V}ar(l), \mathcal{P}os(x\sigma) := \mathcal{P}os(x\tau)$$

The labels of the unmarked underlying substitution are defined by

$$\forall x \in \mathcal{V}\mathrm{ar}(r), \forall u \in \mathcal{P}\mathrm{os}(x\overline{\tau}), x\sigma(u) := x\tau(u)$$
 
$$\forall x \in \mathcal{V}\mathrm{ar}(l) \setminus \mathcal{V}\mathrm{ar}(r), \forall u \in \mathcal{I}\mathrm{n}(x\sigma), x\sigma(u) := x\tau'(u)$$
 
$$\forall x \in \mathcal{V}\mathrm{ar}(l) \setminus \mathcal{V}\mathrm{ar}(r), \forall u \in \mathcal{L}\mathrm{v}(x\sigma), x\sigma(u) \approx x\tau'(u)$$

(this last choice can be made because, for every symbol  $\alpha' \in \mathcal{F}_0 \cup \hat{Q}$  there exists some  $\alpha \in \mathcal{F}_0 \cup Q$ , such that  $\alpha \approx \alpha'$ ) and the marks are defined by

$$\forall x \in \mathcal{V}ar(l), \forall u \in \mathcal{P}os(x\sigma), m(x\overline{\sigma}/u) := m(x\overline{\tau'}/u)$$
 (55)

From (54), the construction of  $\overline{\sigma}$  and (53) follows the property that

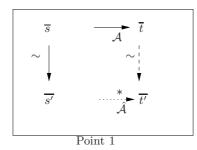

$$\overline{s} \sim \overline{s'}$$
.

Since the marks of  $\overline{\sigma}$  are taken from those of  $\overline{\tau'}$  (see (55)), using the hypothesis that  $\overline{s'} \to_{\hat{S}} \overline{t'}$ , we obtain that

$$\overline{s} \to_{\mathcal{S}} \overline{t}$$
.

### Lemma 4.26.

1-  $\sim$  is a simulation of  $(\mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \rightarrow_{\mathcal{A}})$  by  $(\mathcal{T}((\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V}), \rightarrow_{\hat{\mathcal{A}}}^*)$ . 2-  $\sim^{-1}$  is a simulation of  $(\mathcal{T}((\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V}), \leftarrow_{\hat{\mathcal{A}}})$  by  $(\mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \leftarrow_{\mathcal{A}})$ .

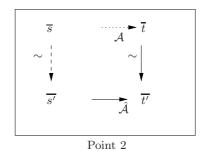

Figure 7: Lemma 4.26

## Proof.

# Point 1

Let us suppose that  $\bar{s}, \bar{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \overline{s'} \in (\mathcal{T}(\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V})$  are such that  $\bar{s} \sim \overline{s'}$  and  $\bar{s} \to_{\mathcal{A}} \bar{t}$ .

Thus

$$\overline{s} = \overline{C}[\overline{l}], \ \overline{t} = \overline{C}[\overline{r}], \ \overline{s'} = \overline{C'}[\overline{l'}]$$

for some contexts  $\overline{C}[], \overline{C'}[]$  and rule  $l \to r \in \Gamma$  fulfilling  $\overline{C}[] \sim \overline{C'}[], \overline{l} \sim \overline{l'}$ .

case 1.1:  $l \to r = a \to q$  for some  $a \in \mathcal{F}_0, q \in Q$ .

We define

$$\overline{t'} := \overline{s'}. \tag{56}$$

Since  $a \to_{\mathcal{A}} q$ , the relation  $q \approx a$  holds, hence  $\overline{t} \sim \overline{t'}$ . It is clear that  $\overline{s'} \to_{\hat{\mathcal{A}}}^* \overline{t'}$ . case 1.2:  $l \to r = f(p_1, \ldots, p_m) \to p$  for some  $m \ge 1, f \in \mathcal{F}_m, p_1, \ldots, p_m, p \in Q$ .

We thus have

$$\overline{l} = \overline{f}(\overline{p}_1, \dots, \overline{p}_m), \ \overline{r} = \overline{p}, \ \overline{l'} = \overline{f}(\overline{P}_1, \dots, \overline{P}_m)$$

for some  $\overline{P}_i \in (\mathcal{F}_0 \cup \hat{Q})^{\mathbb{N}}$  such that  $\overline{p}_i \approx \overline{P}_i$ . Let us define  $\overline{P'} \in \hat{Q}^{\mathbb{N}}$  by

$$P' := Q \cap [f(P_1, \dots, P_m)]_{\to_A^*}, \quad \mathsf{m}(\overline{P'}) := \mathsf{m}(\overline{f})$$
 (57)

and finally

$$\overline{t'} := \overline{C'}[\overline{P'}].$$

Since  $p_i \subseteq P_i$  (if  $P_i \in \hat{Q}$ ) or  $P_i \xrightarrow{*}_{\mathcal{A}} p_i$  (if  $P_i \in \mathcal{F}_0$ ),  $\underline{p} \in P'$ . It follows that  $\overline{t} \sim \overline{t'}$ . The definition (57) of  $\overline{P'}$  also implies that  $\overline{f}(\overline{P}_1, \dots, \overline{P}_m) \to_{\hat{A}} \overline{P'}$ , hence that  $\overline{s'} \to_{\hat{A}} \overline{t'}$ .

#### Point 2

Let us suppose that  $\overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \overline{s'}, \overline{t'} \in (\mathcal{T}(\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V})$  are such that  $\overline{t} \sim \overline{t'}$  and  $\overline{s'} \to_{\hat{A}} \overline{t'}$ .

We know that

$$\overline{t} = \overline{C}[\overline{p}], \ \overline{s'} = \overline{C'}[\overline{l'}], \ \overline{t'} = \overline{C'}[\overline{r'}]$$

for some contexts  $\overline{C}[], \overline{C'}[]$ , symbol  $\overline{p} \in (\mathcal{F} \cup Q)^{\mathbb{N}} \cup \mathcal{V}$  and rule  $l' \to r' \in \hat{\Gamma}$ . Such a rule has the form

$$l' = f(P'_1, \dots, P'_m) \to P' = r'$$
 (58)

where  $P_i' \in \mathcal{F}_0 \cup \hat{Q}, P' \in \hat{Q}$ . Since  $\bar{t} \sim \bar{t'}$ , we must have  $\overline{C} \sim \overline{C'}$  and  $p \in P'$ . Since  $p \in P'$  there exist  $p_1, \ldots, p_m \in \mathcal{F}_0 \cup Q$  such that,  $f(p_1, \ldots, p_m) \to_{\mathcal{A}}^* p$  and, for every  $i \in [1, m]$ , either  $p_i = P_i' \in \mathcal{F}_0$  or  $(p_i \in Q, P_i' \in \hat{Q}, p_i \in P_i')$ . Let us define  $\overline{s}$  by

$$s := C[f(p_1, \dots, p_m)], \ \forall u \in \mathcal{P}os(\overline{s}), m(\overline{s}/u) = m(\overline{s'}/u).$$

Since  $p_i \approx P_i'$  we get that  $\overline{s} \sim \overline{s'}$  and since  $f(p_1, \dots, p_m) \to_{\mathcal{A}}^* p$  we get that  $\overline{s} \to_{\mathcal{A}}^* \overline{t}$ .

As a straightforward consequence of Lemma 4.25 and Lemma 4.26 we get the following lemma.

### Lemma 4.27.

1-  $\sim$  is a simulation of  $(\mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \rightarrow_{\mathcal{S} \cup \mathcal{A}})$  by  $(\mathcal{T}(\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V}), \rightarrow^*_{\hat{\mathcal{S}} \cup \hat{\mathcal{A}}})$ . 2-  $\sim^{-1}$  is a simulation of  $(\mathcal{T}((\mathcal{F} \cup \hat{Q})^{\mathbb{N}}, \mathcal{V}), \leftarrow_{\hat{\mathcal{S}} \cup \hat{\mathcal{A}}})$  by  $(\mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}}, \mathcal{V}), \leftarrow_{\mathcal{S} \cup \mathcal{A}})$ .

Let us show that Theorem 4.2 still holds without assuming (23-24). By §4.2.1 we are reduced to treat the case of a system  $\mathcal{R}$  fulfilling (23). Since  $\hat{\mathcal{A}}$  is standard, Lemma 4.19 applies on  $\mathcal{R}$  and  $\rightarrow_{\hat{\mathcal{S}} \cup \hat{\mathcal{A}}}^*$ . Using then Lemma 4.27 we get that for every term  $s \in \mathcal{T}(\mathcal{F})$ 

$$s \mapsto_{\mathcal{R}}^* T \Leftrightarrow s \to_{\mathcal{S} \cup \mathcal{A}}^* Q_f^{\leq k}$$

and we can conclude, as before, that  $({}_{k} \rightarrow_{\mathcal{R}}^{*})[T]$  is recognizable.

## 4.3. Complexity

The proofs that we gave for Theorem 4.2 are constructive i.e. give an algorithm for computing a non-deterministic f.t.a recognizing ( $_k \rightarrow_{\mathcal{R}}^*)[T]$  from a non-deterministic f.t.a recognizing T and a system  $\mathcal{R}$  which belongs to the subclass  $\mathsf{BU}(k)$ . We sketch here some estimation of the complexity of this algorithm: in §4.3.1 we treat in details the case of semi-Thue systems belonging to  $\mathsf{BU}^-(1)$  and, later on, the case of term rewriting systems in  $\mathsf{BU}^-(1)$ ; in §4.3.2 we sketch an analysis of the more general case of systems in  $\mathsf{BU}^-(k)$ , for any natural integer k. In §4.3.3 we prove a NP-hardness lower-bound showing that some of our upper-bounds cannot (presumably) be significantly improved.

#### 4.3.1. Upper-bounds for systems in BU<sup>-</sup>(1)

Let us treat here the case where  $\mathcal{R}$  belongs to the subclass  $\mathsf{BU}^-(1)$ .

Semi-Thue systems.

**Theorem 4.28.** Let  $\mathcal{F}$  be a signature with symbols of arity  $\leq 1$ , let  $\mathcal{A}$  be some f.t.a recognizing a language  $T \subseteq \mathcal{T}(\mathcal{F})$  and let  $\mathcal{R}$  be a finite rewriting system in  $\mathsf{BU}^-(1)$ . One can compute a f.t.a  $\mathcal{B}$  recognizing  $(\to_{\mathcal{R}}^*)[T]$  in time  $O(|\mathcal{F}| \cdot (\log(|\mathcal{F}|))^3 \cdot ||\mathcal{A}||^3 \cdot ||\mathcal{R}||^3)$ .

Our proof consists in reducing the above problem, via the computation of the ground system S of Section 4.1, to the computation of a set of descendants modulo some set of cancellation rules, which is achieved in cubic time

in [2].

Suppose  $\mathcal{F}$  is a fixed alphabet without arities and  $\mathcal{R}$  is a semi-Thue system over  $\mathcal{F}$ .

We consider the *right-linear* one-step derivation relation generated by  $\mathcal{R}$ : for every  $u, v \in \mathcal{F}^*, u_{rl} \rightarrow_{\mathcal{R}} v$  iff there exist  $w \in \mathcal{F}^*, l \rightarrow r \in \mathcal{R}$  such that

$$u = w \cdot l, \quad v = w \cdot r.$$

The binary relation  $_{rl} \rightarrow_{\mathcal{R}}^*$  is, as usual, the reflexive and transitive closure of  $_{rl} \rightarrow_{\mathcal{R}}$ .

**Lemma 4.29.** Let T be a subset of  $\mathcal{F}^*$ , recognized by a non-deterministic finite automaton  $\mathcal{A}$  and  $\mathcal{R}$  a semi-Thue system over  $\mathcal{F}$ . A n.f.a recognizing  $[T](\ _{tl}\rightarrow_{\mathcal{R}}^*)$  can be computed in time  $O((\|\mathcal{A}\|+\|\mathcal{R}\|)^3)$ .

*Proof.* Let us construct the symmetric alphabet associated with X by adding a twin-letter x' for every letter  $x \in X$ :

$$X' := \{x' \mid x \in X\}, \ \hat{X} := X \cup X'.$$

The map  $x \mapsto x'$  is extended to  $X^*$  by

$$(x_1 \cdot x_2 \cdots x_i \cdots x_n)' := x'_n \cdots x'_i \cdots x'_2 \cdot x'_1.$$

We then define a rational set  $\hat{\mathcal{R}}$  and a semi-Thue system  $\mathcal{D}$  by:

$$\hat{\mathcal{R}} := \{ l'r \mid l \to r \in \mathcal{R} \}^*, \ \mathcal{D} := \{ (xx', \varepsilon) \mid x \in X \}.$$

It is proved in [3] that: for every  $u, v \in X^*$ 

$$u _{\mathsf{r}l} \rightarrow_{\mathcal{R}}^* v \Leftrightarrow u \hat{\mathcal{R}}^* \rightarrow_{\mathcal{D}}^* v$$
  
  $\Leftrightarrow v \in [u \hat{\mathcal{R}}^*](\rightarrow_{\mathcal{D}}^*).$ 

Hence

$$[T](_{rl} \rightarrow_{\mathcal{R}}^*) = [T\hat{\mathcal{R}}^*](\rightarrow_{\mathcal{D}}^*) \tag{59}$$

A n.f.a recognizing  $T\hat{\mathcal{R}}^*$  can be computed in time  $O(\|\mathcal{A}\| + \|\mathcal{R}\|)$ .

By the main result of [2], for every recognizable set R, a n.f.a recognizing  $[R](\to_{\mathcal{D}}^*)$  can be computed in time  $O(n^3)$  where n is the size of a n.f.a recognizing R. Hence a n.f.a recognizing  $[T\hat{\mathcal{R}}^*](\to_{\mathcal{D}}^*)$  can be computed in time  $O((\|A\| + \|\mathcal{R}\|)^3)$  and, by equality (59), the lemma is proved.

**Lemma 4.30.** Suppose that  $\mathcal{F}$  is an alphabet without arities (which is not fixed anymore), T is a recognizable subset of  $\mathcal{F}^*$  and  $\mathcal{R}$  is a semi-Thue system over  $\mathcal{F}$ . Then, a (non-deterministic) finite automaton recognizing  $[T](\ _{rl}\rightarrow_{\mathcal{R}}^{*})$ can be computed in time  $O(|\mathcal{F}| \cdot (\log(|\mathcal{F}|)(||\mathcal{A}|| + ||\mathcal{R}||))^3)$ .

*Proof.* Suppose that  $\mathcal{F} := \{x_1, \dots, x_n\}$  and  $n = 2^p$ . Let  $\varphi : \mathcal{F}^* \to \{a, b\}$  be some suffix encoding. For example we can define  $\varphi(x_i)$  as the *i*-th word in  $\{a,b\}^p$  for some total ordering over  $\{a,b\}^p$ . One can check that

$$[T](_{rl} \rightarrow_{\mathcal{R}}^{*}) = \varphi^{-1}([\varphi(T)](_{rl} \rightarrow_{\varphi(\mathcal{R})}^{*})). \tag{60}$$

A n. f.a  $\mathcal{A}'$  recognizing  $\varphi(T)$  can be computed from  $\mathcal{A}$  in time  $O(\|A\| \cdot p)$  i.e.  $O(||A|| \cdot \log(|\mathcal{F}|))$ . Using the result of Lemma 4.29, a n.f.a  $\mathcal{A}''$  recognizing  $[\varphi(T)]( {}_{rl} \rightarrow^*_{\varphi(\mathcal{R})})$  can be computed in time

 $O((\log(|\mathcal{F}|)(||\mathcal{A}|| + ||\mathcal{R}||))^3)$ . A n.f.a  $\mathcal{B}$  can be obtained from  $\mathcal{A}''$  by the classical construction for the operation  $\varphi^{-1}$ . This gives a complexity: 

$$O(|\mathcal{F}| \cdot (\log(|\mathcal{F}|)(||\mathcal{A}|| + ||\mathcal{R}||))^3).$$

## **Proof** of theorem 4.28.

We suppose now that  $\mathcal{F}$  is a signature with arities in  $\{0,1\}$ , T is a subset of  $\mathcal{T}(\mathcal{F})$  recognized by a f.t.a  $\mathcal{A}$  and  $(\mathcal{R}, \mathcal{F})$  is a rewriting system in  $\mathsf{BU}^-(1)$ . Let  $\mathcal{S} := \{l\tau \to r\tau \mid l \to r \in \mathcal{R}, \tau : \mathcal{V} \to Q\}$ . Since  $\mathcal{R}$  is  $\mathsf{BU}^-(1)$ , by a small variation of Lemma 4.19, for every  $s \in \mathcal{T}(\mathcal{F})$ ,  $s \to_{\mathcal{R}}^* T \Leftrightarrow s \to_{\mathcal{S} \cup \mathcal{A}}^* Q_f$ . Thus

$$(\to_{\mathcal{R}}^*)[T] = [Q_f](\to_{(\mathcal{S} \cup \mathcal{A})^{-1}}^*) \cap \mathcal{T}(\mathcal{F}). \tag{61}$$

Let us denote by  $\mathcal{C}$  the ground rewriting system  $(\mathcal{S} \cup \mathcal{A})^{-1}$ . Let us notice that  $\mathcal{T}(\mathcal{F})$  is a subset of  $\mathcal{F}^*$ . Moreover  $\mathcal{T}(\mathcal{F})$  is saturated by  $_{rl} \rightarrow_{\mathcal{C}}^*$  and the relation  $\to_{\mathcal{C}}^*$  restricted to  $\mathcal{T}(\mathcal{F})$  coincides with  $_{rl}\to_{\mathcal{C}}^*$  restricted to  $\mathcal{T}(\mathcal{F})$ . We can thus apply the results of Lemma 4.30: as  $\|S \cup A\| \le (\|R\| \cdot \|A\|)$ , a f.t.a recognizing  $[Q_f](\to_{\mathcal{C}}^*[T])$  can be computed in time  $O(|\mathcal{F}| \cdot (\log(|\mathcal{F}|)(||\mathcal{R}|| \cdot ||\mathcal{A}|| + ||\mathcal{R}||))^3)$  hence in time

$$O(|\mathcal{F}| \cdot (\log(|\mathcal{F}|))^3 \cdot ||\mathcal{R}||^3 \cdot ||\mathcal{A}||^3).$$

Let us recall that every left-basic semi-Thue system can be viewed as a BU<sup>-</sup>(1) term rewriting system (Lemma 3.22). This Theorem 4.28 thus extends [2], where a cubic complexity is proved for *cancellation systems* over a fixed alphabet, and improves [1], where a degree 4 complexity is proved for basic semi-Thue systems.

Term rewriting systems. Let us turn now to term rewriting systems over arbitrary signatures. The following refinement of Theorem 4.1 has been proved in [11]

**Theorem 4.31.** Let T be a finite set of terms and S be a ground term rewriting system. A f.t.a recognizing the set  $[T] \to_{S}^{*}$  can be computed in time which is a polynomial function of Card(T) + ||S||.

Given a system  $\mathcal{R}$  we recall the maximum arity of  $\mathcal{R}$  was defined in §2.4 by:

$$\mathsf{A}(\mathcal{R}) := \max\{\mathsf{Card}(\mathcal{P}\mathsf{os}_{\mathcal{V}}(l)) \mid l \to r \in \mathcal{R}\}.$$

We extend the above complexity result into the following

**Theorem 4.32.** Let  $(\mathcal{R}, \mathcal{F})$  be a finite rewriting system in  $\mathsf{BU}^-(1)$  and let  $\mathcal{A}$  be some f.t.a over  $\mathcal{F}$  recognizing a set of terms  $T \subseteq \mathcal{T}(\mathcal{F})$ . One can compute a f.t.a  $\mathcal{B}$  recognizing  $(\to_{\mathcal{R}}^*)[T]$  in time polynomial w.r.t.  $\|\mathcal{R}\| \cdot \|\mathcal{A}\|^{\mathsf{Max}\{\mathsf{A}(\mathcal{R}),1\}}$ .

Our proof consists in computing the ground system S of Section 4.1 and to apply Theorem 4.31.

*Proof.* Let us consider the system

$$\mathcal{S} := \{ l\tau \to r\tau \mid l \to r \in \mathcal{R}, \tau : \mathcal{V} \to Q \}.$$

One can check that

$$\|\mathcal{S}\| \le \|\mathcal{R}\| \cdot |Q|^{\mathsf{A}(\mathcal{R})}.$$

By the same arguments as in the case of arities not bigger than 1, we still get that

$$(\to_{\mathcal{R}}^*)[T] = [Q_f](\to_{\mathcal{C}}^*) \cap \mathcal{T}(\mathcal{F})$$
(62)

where  $\mathcal{C} := (\mathcal{S} \cup \mathcal{A})^{-1}$ . It is clear that

$$\|\mathcal{C}\| \le \|\mathcal{R}\| \cdot |Q|^{\mathsf{A}(\mathcal{R})} + \|\mathcal{A}\| \le \|\mathcal{R}\| \cdot \|\mathcal{A}\|^{\mathsf{A}(\mathcal{R})}.$$

By Theorem 4.31, a f.t.a  $\mathcal{A}'$  recognizing  $[Q_f](\to_{\mathcal{C}}^*)$  can be computed in P-time w.r.t.  $|Q_f|+\|\mathcal{C}\|$ , thus in P-time w.r.t  $\|\mathcal{R}\|\cdot\|\mathcal{A}\|^{\max\{A(\mathcal{R}),1\}}$ . Let  $\mathcal{F}'\subseteq\mathcal{F}$  be the subset of symbols that have at least one occurrence either in the transitions of  $\mathcal{A}$  or in the rules of  $\mathcal{R}$ . By a direct product with the obvious f.t.a recognizing  $\mathcal{T}(\mathcal{F}')$  we can compute a f.t.a  $\mathcal{B}$  recognizing  $[Q_f](\to_{\mathcal{C}}^*)\cap\mathcal{T}(\mathcal{F}')$ . The overall computation of  $\mathcal{B}$  takes a P-time w.r.t  $|\mathcal{F}'|\cdot\|\mathcal{R}\|\cdot\|\mathcal{A}\|^{\max\{A(\mathcal{R}),1\}}$ . But  $|\mathcal{F}'|\leq \|\mathcal{R}\|+\|\mathcal{A}\|$ . Hence the computation takes a P-time w.r.t

$$\|\mathcal{R}\|\cdot\|\mathcal{A}\|^{\mathsf{Max}\{\mathsf{A}(\mathcal{R}),1\}}.$$

By (62), this automaton  $\mathcal{B}$  recognizes  $(\to_{\mathcal{R}}^*)[T]$ .

## 4.3.2. Upper-bounds for systems in $BU^{-}(k)$

The upper-bounds resulting from the use of the precise system S from Definition 4.10 would be unnecessarily high. Therefore we start this subsection by defining a smaller ground system  $S_1 \subseteq S$ . Subsequently we sketch a proof that the refined system  $S_1$  can also simulate the original system R. Finally, we derive from this improved construction an upper-bound on the complexity of constructing a f.t.a for the set of ancestors of a recognizable set of terms.

Let us define the set of subterms of the lhs of  $\mathcal{R}$  by

$$\mathsf{SLHS}(\mathcal{R}) := \{ t \in \mathcal{T}(\mathcal{F}, \mathcal{V}) \mid \exists \ell \to r \in \mathcal{R}, \exists C \in \mathcal{C}_1(\mathcal{F}), \ell \equiv_{\alpha} C[t] \}.$$

In words:  $\mathsf{SLHS}(\mathcal{R})$  consists of all subterms of left-handsides of rules of  $\mathcal{R}$ , up to renaming of the variables. Let us say that a TRS  $(\mathcal{R}, \mathcal{F})$  is variable-free iff it has no variable left-handside nor variable right-handside. From now on, and until the statement of Theorem 4.32, all definitions, lemmas and propositions assume that the TRS  $\mathcal{R}$  under consideration is variable-free.

**Definition 4.33.** Let  $\mathcal{R}$  be some TRS over the signature  $\mathcal{F}$ . We consider the ground rewriting system  $\mathcal{S}_1$  over  $\mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  consisting of all the rules of the form:

$$\bar{l}\overline{\tau} \to r\overline{\overline{\tau}} \tag{26}$$

where  $l \to r$  is a rule of  $\mathcal{R}$ 

$$\mathsf{m}(\overline{l}) = 0 \tag{27}$$

and  $\overline{\tau}: \mathcal{V} \to \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  is a marked substitution such that,  $\forall x \in \mathcal{V}ar(l)$ 

$$x\overline{\overline{\tau}} = x\overline{\tau} \odot M(\overline{l}, x) \tag{63}$$

and, there exists substitutions  $\tau_i: \mathcal{V} \to \mathsf{SLHS}(\mathcal{R})$  for  $1 \leq i \leq k-1$  and  $\tau_k: \mathcal{V} \to Q$  such that

$$\tau = \tau_1 \circ \tau_2 \cdots \circ \tau_i \circ \cdots \circ \tau_k. \tag{64}$$

# Lemma 4.34. $S_1 \subseteq S$

*Proof.* Conditions (26,27) are those imposed on the rules of S in Definition 4.10. For every  $x \in V$ ,  $\tau_i(x)$  has a depth smaller or equal to d implying that the additional condition (28) of Definition 4.10 also holds.

**Lemma 4.35** (lifting  $S_1 \cup A$  to R).

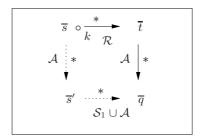

Let  $\overline{s}, \overline{s'}, \overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that  $\overline{s'}$  is m-increasing. If  $\overline{s'} \to_{\mathcal{A}}^* \overline{s}$  and  $\overline{s} \to_{\mathcal{S}_1 \cup \mathcal{A}}^* \overline{t}$  then, there exists a term  $\overline{t'} \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that  $\overline{s'}_k \to_{\mathcal{A}}^* \overline{t'}$  and  $\overline{t'} \to_{\mathcal{A}}^* \overline{t}$ .

*Proof.* By Lemma 4.34,  $S_1 \subseteq S$ . We assume that R has no variable lhs so that, by remark 4.12, Lemma 4.11 holds. These two lemmas imply the above lemma.

**Lemma 4.36** (projecting  $\mathcal{R}$  on  $\mathcal{S}_1 \cup \mathcal{A}$ ).

Let  $\overline{s}, \overline{t} \in \mathcal{T}(\mathcal{F}^{\leq k}), q \in Q^0$ . If  $\overline{s}_k \circ \to_{\mathcal{R}}^* \overline{t}$  is a bu<sup>-</sup>(k) derivation,  $\overline{s}$  is tm-increasing and  $\overline{t} \to_{\mathcal{A}}^* q$  then, there exists a term  $\overline{s}' \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that

$$\overline{s} \to_{\mathcal{A}}^* \overline{s}' \to_{\mathcal{S}_1 \sqcup \mathcal{A}}^* q.$$

Projecting  $\mathcal{R}$ 

Figure 8: Lemma 4.36

The proof of this lemma will be given only ten pages later, at a point where sufficient technical preparation will have been achieved.

In order to prove this lemma, by induction over the length of derivation  $\overline{s}_k \circ \to_{\mathcal{R}}^* \overline{t}$ , we introduce a notion of decomposition of a term relative to a derivation (modulo  $\mathcal{R} \cup \mathcal{A}$ ) that starts from this term. Each component of the decomposition is called a *cascade* and the full decomposition is called a *bunch of cascades*.

We shall examine, in the sequel, marked derivations of the following form:

$$\overline{D}: \overline{t}_0 \circ \to_{\mathcal{R}} \to_{\mathcal{A}}^* \cdots \circ \to_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t}_i \circ \to_{\mathcal{R}} \to_{\mathcal{A}}^* \cdots \circ \to_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t}_{\ell}$$
 (65)

where the i-th step

$$\overline{t}_i \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t}_{i+1}$$
(66)

starts with an application of a rule  $l_i \to r_i \in \mathcal{R}$ :

$$\overline{t}_i = \overline{C}_i [\overline{\ell}_i \overline{\sigma}_i] \hookrightarrow_{\mathcal{R}} \overline{C}_i [r_i \overline{\overline{\sigma}}_i] \to_{\mathcal{A}}^* \overline{t}_{i+1}$$

$$(67)$$

For every  $i \in [0, \ell]$ , we denote by  $D_i$  the subderivation

$$\overline{D}_i : \overline{t}_i \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \cdots \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t}_{\ell}.$$

(for  $i = \ell$ ,  $\overline{D}_i$  is the derivation of length null starting from  $\overline{t}_\ell$ ). These marked derivations  $\overline{D}$ ,  $\overline{D}_i$  are mapped, by removal of the marks, to derivations D,  $D_i$  for the system  $\mathcal{R} \cup \mathcal{A}$ . The notion of residual that we use below is defined w.r.t. to these derivations.

Let us introduce a notion of cascade: intuitively, a cascade is a subterm such that, all its internal nodes will contribute to a lhs of rule in the future. More precisely, a cascade of level h can be layered into at most h comparable occurrences which will be used, successively, from top to bottom, in the rest of the derivation.

**Definition 4.37** (Cascade). Let  $\overline{D}$  be some derivation (modulo  $\mathcal{R} \cup \mathcal{A}$ ) of the form (65-67). We define inductively, for pairs  $(h,i) \in \mathbb{N} \times [0,\ell]$ , the notion of cascade of level h w.r.t.  $\overline{D}_i$ . Let  $\overline{S} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}})$  such that  $\overline{S}$  is a subterm of  $\overline{t}_i$  and let  $h \in \mathbb{N}$ 

C1- If  $\overline{S} \in (\mathcal{F}_0 \cup Q)^{\mathbb{N}}$ , then  $\overline{S}$  is a cascade of level h w.r.t.  $\overline{D}_i$ 

C2- If  $\overline{S}$  has the form  $\overline{S} = \overline{s}\overline{\sigma}$  (for some term  $\overline{s} \notin \mathcal{V}$  and substitution  $\overline{\sigma}$ ) and  $\exists \lambda \geq 0$  fulfilling the conjunction of conditions  $C_{2.1}, C_{2.2}, C_{2.3}$  below, then  $\overline{S}$  is a cascade of level h + 1 w.r.t.  $\overline{D}_i$ 

C2.1 the occurrence of s in S has a residue in  $t_{i+\lambda}$  which is a subterm of the occurrence of  $l_{i+\lambda}$  (used in the  $(i+\lambda)$ -th step of D)

C2.2 for every variable  $x \in Var(l_{i+\lambda}) \cap Var(r_{i+\lambda})$ , occurring at the frontier of the given occurrence of s in  $l_{i+\lambda}$ ,  $\exists y \in Var(s)$ ,  $x\overline{\sigma}_{i+\lambda}$  is a residue of  $y\sigma$  and  $x\overline{\sigma}_{i+\lambda}$  is a cascade of level h w.r.t.  $\overline{D}_{i+\lambda}$ ,

C2.3 for every variable  $x \in \mathcal{V}ar(l_{i+\lambda}) \setminus \mathcal{V}ar(r_{i+\lambda})$ , occurring at the frontier of the given occurrence of s in  $l_{i+\lambda}$ ,  $\exists y \in \mathcal{V}ar(s)$ ,  $x\overline{\sigma}_{i+\lambda}$  is a residue of  $y\sigma$  and  $y\overline{\sigma} \in (\mathcal{F}_0 \cup Q)^{\mathbb{N}}$ .

We call source of the cascade  $\overline{S}$  the given occurrence of the factor  $\overline{s}$  in  $\overline{t}_i$ .

We illustrate on several figures the notion of cascade. A black node on such a figure indicates a node labelled by an element of  $(\mathcal{F}_0 \cup Q)^{\mathbb{N}}$ . Figure 9 illustrates the general features of case C2.

The three figures 10-12 sketch a cascade of level 3, where only rewriting steps in  $\mathcal{R}$  are used; each one of these sketches the positions of redex and contractum for one rewriting step.

Note that, by Definition 4.37:

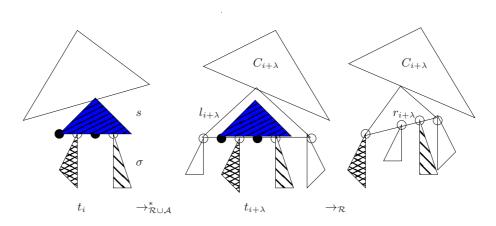

Figure 9: A cascade: condition C2

- every cascade of level h w.r.t.  $\overline{D}_i$  is also a cascade of level  $h+1,h+2,\ldots$  w.r.t.  $\overline{D}_i$ ;
- if  $\overline{D}$  is a marked derivation of length one,

$$\overline{D}: \bar{C}[\bar{l}\bar{\sigma}] \hookrightarrow_{\mathcal{R}} \bar{C}[r\overline{\overline{\sigma}}],$$

- every ground subterm of the given occurrence of  $\bar{l}$  is a cascade of level 1 w.r.t.  $\bar{D}$  (because C2.1 holds while the universally quantified conditions C2.2, C2.3. are trivially true);
- the given subterm  $\bar{l}\bar{\sigma}$  is a cascade of level 1 w.r.t.  $\overline{D}$  iff  $\bar{\sigma}$  maps every variable  $x \in \mathcal{V}ar(l)$  into  $(\mathcal{F}_0 \cup Q)^{\mathbb{N}}$ .

**Example 4.38.** Let us consider the alphabet  $\mathcal{F} := \{a, b, c, \#_0\}$  where a, b, c have arity 1 and  $\#_0$  has arity 0. Let  $\mathcal{R}$  consist of the rules

$$a \rightarrow cb \ bcb \rightarrow ba \ ab \rightarrow ba$$

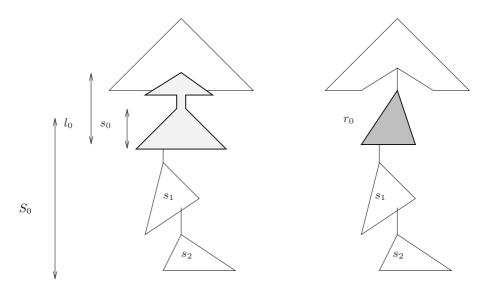

Figure 10: A cascade of level 3: first step

Let A be a f.t.a with set of states  $Q := \{q, r\}$  and set of rules

$$\#_0 \to q \ \forall s \in Q, as \to r, bs \to s, cs \to s$$

Let  $\bar{D}$  be the derivation:

$$\begin{array}{ll} \lfloor a \rfloor cbbbq & \hookrightarrow_{\mathcal{R}} & \lfloor cb \rfloor c^1b^1b^1b^1q^1 = c\lceil bc^1b^1\rceil b^1b^1q^1 \\ & \hookrightarrow_{\mathcal{R}} & c\lceil ba\rceil b^2b^2q^2 = cb\lfloor ab^2\rfloor b^2q^2 \\ & \hookrightarrow_{\mathcal{R}} & cb\lfloor ba\rfloor b^3q^3 = cbb\lceil ab^3\rceil q^3 \\ & \hookrightarrow_{\mathcal{R}} & cbbbaq^4 \to_{\mathcal{A}}^* r. \end{array}$$

 $q^3$  is a cascade of level 0 w.r.t. to the derivation  $cbbab^3q^3 \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* r$   $b^3q^3$  is a cascade of level 1 w.r.t.  $cbbab^3q^3 \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* r$   $b^2b^2q^2$  is a cascade of level 2 w.r.t.  $cbab^2b^2q^2 \hookrightarrow_{\mathcal{R}}^2 \to_{\mathcal{A}}^* r$   $c^1b^1b^1b^1q^1$  is a cascade of level 3 w.r.t.  $cbc^1b^1b^1b^1q^1 \hookrightarrow_{\mathcal{R}}^3 \to_{\mathcal{A}}^* r$  cbbbq is a cascade of level 3 w.r.t.  $acbbbq \hookrightarrow_{\mathcal{R}}^4 \to_{\mathcal{A}}^* r$  acbbbq is a cascade of level 4 w.r.t.  $acbbbq \hookrightarrow_{\mathcal{R}}^4 \to_{\mathcal{A}}^* r$ 

**Example 4.39.** Let us adapt the example above to symbols with larger arity. Let  $\mathcal{F} := \{A, B, C, \#_0\}$  where A has arity 2, B, C have arity 1 and  $\#_0$  has arity 0. Let  $\mathcal{R}$  consist of the rules

$$A(x,y) \rightarrow CBy \ BCBx \rightarrow BA(A(\#_0,\#_0),x) \ A(x,By) \rightarrow BA(BB\#_0,y)$$

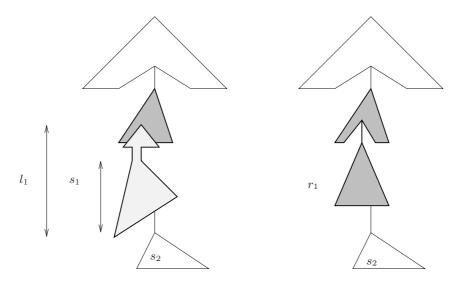

Figure 11: A cascade of level 3: second step

Let A be a f.t.a with set of states  $Q := \{q, r\}$  and set of rules

$$\#_0 \to q \ \forall s, t \in Q, A(s,t) \to r \ Bs \to s \ Cs \to s$$

Let  $\bar{D}$  be the derivation:

$$A(q, CBBBq) \quad \Leftrightarrow_{\mathcal{R}} \quad CBC^{1}B^{1}B^{1}B^{1}q^{1}$$

$$\Leftrightarrow_{\mathcal{R}} \quad CBA(A(\#_{0}, \#_{0}), B^{2}B^{2}q^{2}) \rightarrow_{\mathcal{A}}^{*} CBA(r, B^{2}B^{2}q^{2})$$

$$\Leftrightarrow_{\mathcal{R}} \quad CBBA(A(\#_{0}, \#_{0}), B^{3}q^{3}) \rightarrow_{\mathcal{A}}^{*} CBBA(r, B^{3}q^{3})$$

$$\Leftrightarrow_{\mathcal{R}} \quad CBBBA(BB\#_{0}, q^{4}) \rightarrow_{\mathcal{A}}^{*} r.$$

 $q^3$  is a cascade of level 0 w.r.t. to the derivation  $CBBA(r, B^3q^3) \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* r$   $B^3q^3$  is a cascade of level 1 w.r.t.  $CBBA(r, B^3q^3) \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* r$   $B^2B^2q^2$  is a cascade of level 2 w.r.t.  $CBA(r, B^2B^2q^2)(\hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^*)^2r$   $C^1B^1B^1B^1q^1$  is a cascade of level 3 w.r.t.  $CBC^1B^1B^1B^1q^1(\hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^*)^3r$  CBBBq is a cascade of level 3 w.r.t.  $A(q, CBBBq)(\hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^*)^4r$  A(q, CBBBq) is a cascade of level 4 w.r.t.  $A(q, CBBBq)(\hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^*)^4r$ .

**Lemma 4.40** (Subcascade). If  $\overline{S}$  is a cascade of level h w.r.t. a derivation  $\overline{D}$  and  $\overline{S}'$  is a subterm of  $\overline{S}$ , then  $\overline{S}'$  is also a cascade of level h w.r.t.  $\overline{D}$ .

This can be proved by induction on h.

When such a situation occurs,  $\overline{S}'$  is called a *subcascade* of  $\overline{S}$  w.r.t.  $\overline{D}$ .

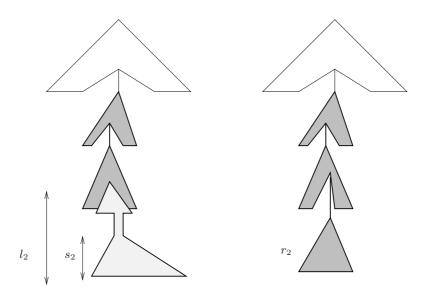

Figure 12: A cascade of level 3: third step

**Definition 4.41** (Null transversal). Let  $\overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}})$  and let  $U = (u_0, u_1, \dots, u_m)$  be a transversal of  $\overline{t}$ . The transversal U is said null iff

$$\forall i \in [0, m], \mathbf{m}(\overline{t}/u_i) = 0.$$

In words: every node of U has a null mark.

**Definition 4.42** (Bunch of cascades). Let  $\overline{D}$  be a derivation fo the form (65-67).

A term  $\overline{t} \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}})$  is called a bunch of cascades w.r.t. derivation  $\overline{D}$  iff,

 $\overline{t} = \overline{t}_0$  and  $\mathcal{P}os(\overline{t})$  has a transversal  $U = (u_0, \underline{u_1}, \dots, u_m)$  such that

(BC1) every subterm  $\overline{t}/u_i$  is a cascade w.r.t.  $\overline{D}$ 

(BC2) U is a null transversal

(BC3) either  $\overline{D}$  has null length or the (marked) occurrence of  $l_0$  which is used in the first step of  $\overline{D}$  is the source of one of the cascades  $\overline{t}/u_i$ .

Figure 13 represents a bunch of cascades where m=8, the cascades at nodes  $u_0, u_1, u_3, u_5, u_6, u_8$  have level 0, at nodes  $u_2, u_4$  level 3, at node  $u_7$  level 2.

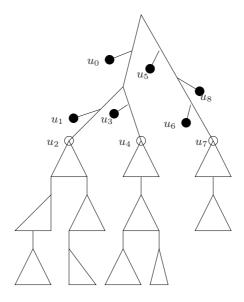

Figure 13: A bunch of cascades

**Definition 4.43.** A marked term  $\overline{s}$  is said tamely increasing (tm-increasing in short) iff, for every  $u, v \in \mathcal{P}os(\overline{s}), i, j \in \mathbb{N}$ , both conditions (TM1),(TM2) below are fulfilled:

```
\begin{array}{l} (TM1) \ u \preceq v \Rightarrow \mathsf{m}(\overline{s}/u) \leq \mathsf{m}(\overline{s}/v) \\ (TM2) \ u \cdot i \in \mathcal{P}\mathsf{os}(\overline{s}) \ and \ u \cdot j \in \mathcal{P}\mathsf{os}(\overline{s}) \Rightarrow \mathsf{m}(\overline{s}/u \cdot i) = \mathsf{m}(\overline{s}/u \cdot j). \end{array}
```

In words:  $\bar{s}$  has marks which increase from root to leaves and which are equal on brothers.

**Lemma 4.44.** Assume that  $\mathcal{R}$  is a variable-free TRS,  $\mathcal{A}$  is a f.t.a and  $\bar{s}$  is tm-increasing.

1- If  $\bar{s} \hookrightarrow_{\mathcal{R}} \bar{t}$  is a wbu marked derivation step, then  $\bar{t}$  is tm-increasing. 2- If  $\bar{s} \hookrightarrow_{\mathcal{A}} \bar{t}$  then  $\bar{t}$  is tm-increasing.

*Proof.* Let  $\mathcal{R}$ ,  $\mathcal{A}$  and  $\bar{s}$  fulfill the hypotheses of the lemma.

- 1- Suppose that  $\bar{s} \hookrightarrow_{\mathcal{R}} \bar{t}$  by a wbu derivation step of the form (14) where the position of  $\Box$  in C is  $u_0$ . By Lemma 3.13  $\bar{t}$  is m-increasing. Let  $u \cdot i, u \cdot j$  be brother postions of  $\bar{t}$ .
  - If  $u \cdot i, u \cdot j$  are non-variable positions of C, then, by hypothesis on  $\bar{s}$  they have the same mark.

- If  $u \cdot i$  is a non-variable position of C and  $u \cdot j$  is the position of  $\square$  in C, then, since the derivation-step is wbu the mark of  $u \cdot j$  in  $\bar{s}$  is null, hence the mark of  $u \cdot i$  in  $\bar{s}$  is null (as a brother of  $u \cdot i$ ), hence the mark of  $u \cdot i$  in  $\bar{t}$  is null. The mark of  $u \cdot j$  in  $\bar{t}$  is the mark of the root of the rhs, which is null (because  $\mathcal{R}$  has no variable rhs).
- If  $u \cdot i, u \cdot j$  are positions in  $r\overline{\overline{\sigma}}$  i.e. there exists  $v \in \mathbb{N}^*$  such that  $u \cdot i = u_0 \cdot v \cdot i, u \cdot j = u_0 \cdot v \cdot j$ , then, either they are brother positions in r and they are both null, or they are brother positions in  $x\overline{\overline{\sigma}}$  (for some variable x); in this last case, by hypothesis on  $\bar{s}$  the corresponding positions in  $\bar{s}$  have the same mark m, hence they are both marked by  $\max(m, M(\overline{C}[l], x))$  in  $\bar{t}$ .
- 2- Since the binary relation  $\rightarrow_{\mathcal{A}}$  does not modify the marks of the nodes, the preservation property is true.

**Lemma 4.45** (projecting one step of  $\mathcal{R}$  on a cascade). Let

$$\overline{D}_1: \overline{t'}_1 \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t'}_2 \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \cdots \hookrightarrow_{\mathcal{R}} \overline{t'}_i \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \cdots \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t'}_{\ell}$$

and let  $\overline{t}_0, \overline{t}_1 \in \mathcal{T}(\mathcal{F}^{\leq k})$  be tm-increasing terms such that

1-  $\overline{t}_0 \xrightarrow{k} \longrightarrow_{\mathcal{R}} \overline{t}_1 is \text{ wbu}$ 

2-  $\overline{t}_1 \to_A^* \overline{t}_1'$  and 3-  $\overline{t}_1'$  is a bunch of cascades w.r.t.  $\overline{D}_1$ . Then, there exists a term  $\overline{t}_0' \in \mathcal{T}((\mathcal{F} \cup Q)^{\leq k})$  such that

$$\overline{t}_0 \to_{\mathcal{A}}^* \overline{t}'_0 \ _k \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t}'_1,$$

and  $\overline{t}'_0$  is a bunch of cascades w.r.t. the derivation  $\overline{D}_0$  obtained from  $\overline{D}_1$  by extension on the left by the step  $\overline{t}'_0 \hookrightarrow_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t}'_1$ .

Diagram:

$$\overline{D}_{0}: \overline{t}_{0} \xrightarrow{k} \xrightarrow{k} \overline{t}_{1}$$

$$\downarrow^{*}_{\mathcal{A}} \qquad \qquad \downarrow^{*}_{\mathcal{A}}$$

$$\overline{D}_{0}: \overline{t}'_{0} \xrightarrow{k} \xrightarrow{k} \xrightarrow{k} \xrightarrow{t'_{1}} \xrightarrow{k} \xrightarrow{k} \xrightarrow{k} \cdots \xrightarrow{k} \xrightarrow{k} \overline{t}'_{\ell}$$

Sketch of proof.

Let  $l_0 \to r_0$  be the rule used in the one-step derivation  $\overline{t}_0 \circ \to_{\mathcal{R}} \overline{t}_1$  and let

 $y_0 \in \mathcal{P}os(t_0)$  be the position of the occurrence of  $l_0$  used in this rewriting step. Let  $U = (u_0, \ldots, u_i, \ldots, u_m)$  be the null transversal provided by Definition 4.42 applied on  $\overline{t}'_1$ . Let us construct a term  $\overline{t}''_1$  and a term  $\overline{t}'_0$  such that

$$\overline{t}'_0 \hookrightarrow_{\mathcal{R}} \overline{t''}_1 \rightarrow_{\mathcal{A}}^* \overline{t'}_1$$

and  $\overline{t}_0'$  fulfils the properties announced by the lemma. We define

$$P := \mathsf{CL}(\mathcal{P}\mathsf{os}(\overline{t_1}') \cup y_0 \cdot \mathcal{P}\mathsf{os}(r_0), \mathcal{P}\mathsf{os}(\overline{t_1})) \tag{68}$$

We then define  $\overline{t}_1'': P \to (\mathcal{F} \cup Q)^{\mathbb{N}}$  by, for every  $u \in P$ :

if 
$$u \in \mathcal{I}\mathsf{n}(P)$$
,  $\overline{t}_1''(u) := \overline{t}_1(u)$ ; if  $u \in \mathcal{L}\mathsf{v}(P)$ ,  $\overline{t}_1''(u) := \rho_1(u)$ ; (69)

where  $\rho_1$  is the partial run of the automaton  $\mathcal{A}$  associated with the computation  $\overline{t}_1 \to_{\mathcal{A}}^* \overline{t}_1'$ . Let  $t_0'$  be the unmarked term obtained from  $t_1''$  by applying the rule  $l_0 \to r_0$  "backwards" at position  $y_0$ :

$$t_0' = C[l_0\tau]_{y_0}, \ t_1'' = C[r_0\tau]_{y_0}$$

where the substitution  $\tau$  is defined by:

- if  $x \in \mathcal{V}ar(l_0) \cap \mathcal{V}ar(r_0)$ ,  $\tau(x) = t_1/(y_0 \cdot pos(r_0, x))$ .
- if  $x \in \mathcal{V}ar(l_0) \setminus \mathcal{V}ar(r_0)$ ,  $\tau(x) = \rho_0(y_0 \cdot pos(l_0, x))$ .

where  $\rho_0$  is any run of the automaton  $\mathcal{A}$  over the term  $\overline{t}_0/y_0 \cdot pos(l_0, x)$ . Finally, let  $\overline{t}'_0$  be the marked term obtained from the domain and labels of  $t'_0$  (on one hand) and the marks of  $\overline{t}_0$  (on the other hand). One can check that:

$$\overline{t}_0 \to_{\mathcal{A}}^* \overline{t}'_0 \ _k \hookrightarrow_{\mathcal{R}} \overline{t}''_1 \to_{\mathcal{A}}^* \overline{t}'_1.$$
(70)

We distinguish two cases, according to the relative position of the root  $y_0$  of the given occurrence of  $r_0$  and of the transversal U.

Case 1:  $y_0$  is above at least one  $u_i$  (see Figure 14).

Let us suppose that  $y_0 \leq u_i, y_0 \leq u_{i+1}, \ldots, y_0 \leq u_{i+p}$  and  $\forall j \in [0, i-1] \cup [i+p+1, m], y_0 \not\leq u_j$  (see Figure 14). Let

$$U_0 := (u_0, \dots, u_{i-1}, y_0, u_{i+p+1}, \dots, u_m).$$

 $U_0$  is a transversal of  $\overline{t}_0'$ . Condition (BC1) is clearly fulfilled by the  $u_j$ , for  $j \in [0, i-1] \cup [i+p+1, m]$ . Since the transversal U of term  $\overline{t}_1'$  was fulfilling condition (BC2) and  $\overline{t}_1'$  is m-increasing, no leaf of the occurrence of  $r_0$  can be strictly above U. Hence  $\overline{t}_1'/y_0$  consists of an occurrence of  $r_0$  followed by

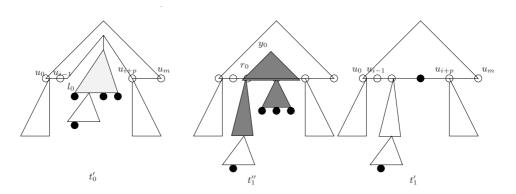

Figure 14: Lemma 4.45, Case 1

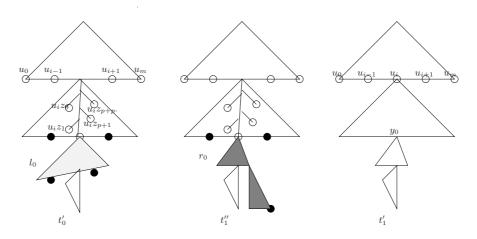

Figure 15: Lemma 4.45, Case 2

some subcascades  $\overline{S}_1, \overline{S}_2, \ldots, \overline{S}_{\mu}$  of the cascades  $\overline{t}'_1/u_j$  (for  $j \in [i, i+p]$ ) and, possibly, some new cascades of level 0. Thus,  $\overline{t}'_0/y_0$  consists of an occurrence of a marked version of  $l_0$  followed by some subterms which have the residuals  $\overline{S}_1, \overline{S}_2, \ldots, \overline{S}_{\mu}$  inside  $\overline{t}'_1$  and, possibly, some new cascades of level 0: this is a cascade for  $\overline{D}_0$ . We have thus checked condition (BC1). Let  $v \in U_0$ .

- If  $v=u_j$ , for some  $j\in [0,i-1]\cup [i+p+1,m]$ , since U was null,  $\mathsf{m}(\overline{t}_1'/u_j)=0$ . But the mark of this position is the same in  $\overline{t}_1'$  and in  $\overline{t}_0'$ , hence  $\mathsf{m}(\overline{t}_0'/u_j)=0$ .
- If  $v = y_0$ , since it is the position of the root of  $l_0$  in  $\overline{t}_0$  and this derivation-

step is wbu,  $m(\overline{t}'_0/v) = 0$ .

We have checked that  $U_0$  is null (i.e. (BC2)).

The occurrence of  $l_0$  which is used in the first step of  $\overline{D}$  is the source of the cascade at position  $y_0$ , hence (BC3) holds.

Case 2:  $y_0$  is strictly below one  $u_i$  (see Figure 15).

Let  $(z_0, \ldots, z_p, (u_i)^{-1}y_0, z_{p+1}, \ldots, z_{p+p'})$  be the smallest transversal of  $\overline{t}'_0/u_i$  extending the antichain  $(u_i^{-1}y_0)$  (see Lemma 2.2). Let

$$U_0 := (u_0, \dots, u_{i-1}, u_i z_0, \dots, u_i z_p, y_0, u_i z_{p+1}, \dots, u_i z_{p+p'}, u_{i+1}, \dots, u_m).$$

 $U_0$  is a transversal of  $\overline{t}_0'$ . Every  $\overline{t}_0'/u_j$  for  $j \in [0, i-1] \cup [i+1, m]$ , is a cascade (because it was a cascade of  $\overline{t}_1'$  w.r.t.  $\overline{D}_1$ ). The subterm  $\overline{t}_0'/y_0$  is a new cascade, consisting of a marked version of  $l_0$  followed by some subcascades of  $\overline{t}_1'/u_i$  and, possibly, some new cascades of level 0. Every subterm  $\overline{t}_0'/u_i z_\lambda$ , for  $\lambda \in [0, p+p']$  has, as residue in  $\overline{t}_1'$ , the subterm  $\overline{t}_1'/u_i z_\lambda$ , which is subcascade of the cascade  $\overline{t}_1'/u_i$  w.r.t.  $\overline{D}_1$ . We have thus checked condition (BC1). Let  $v \in U_0$ .

- If  $v=u_j$ , for some  $j\in [0,i-1]\cup [i+1,m]$ , since U was null and the mark of  $u_j$  is the same in  $\overline{t}_0'$  and in  $\overline{t}_1'$ ,  $\mathbf{m}(\overline{t}_0'/v)=0$ .
- If  $v = y_0$ , since it is the position of the root of  $l_0$  in  $\overline{t}_0$  and this derivation-step is wbu,  $\mathsf{m}(\overline{t}_0'/v) = 0$ .
- If  $v=u_iz_\lambda$ , by point 3 of Lemma 2.2, the father  $z'_\lambda$  of  $z_\lambda$  fulfills  $(u_iz'_\lambda \prec u_iz_\lambda \& u_iz'_\lambda \prec y_0$ ; since  $\overline{t}'_0$  is m-increasing, we obtain that  $\mathsf{m}(\overline{t}'_0/u_iz'_\lambda)=0$  and , since  $\overline{t}'_0$  is tm-increasing, we obtain that  $\mathsf{m}(\overline{t}'_0/u_iz_\lambda)=0$ .

We have checked that  $U_0$  is null (i.e. (BC2)).

The occurrence of  $l_0$  which is used in the first step of  $\overline{D}$  is the source of the cascade at position  $y_0$ , hence (BC3) holds.

**Definition 4.46.** Let  $\overline{D}$  be a derivation of the form (65). A term  $S \in \mathcal{T}((\mathcal{F} \cup Q)^{\mathbb{N}})$  is called a cascade of exact level h w.r.t.  $\overline{D}$  iff S is a cascade of level h w.r.t.  $\overline{D}$  and S is not a cascade of level h - 1 w.r.t.  $\overline{D}$ .

Note that, by this definition, every cascade of level 0 is also a cascade of exact level 0.

**Definition 4.47.** Let  $\overline{D}$  be a derivation of the form (65-67). The marked derivation  $\overline{D}$  is  $\mathsf{bu}^-(k)$  iff,  $\forall i \in [0, \ell]$ ,  $\mathsf{mmin}(\overline{l_i}) = 0$  and  $\mathsf{mmax}(\overline{l_i}) < k$ .

In words:  $\overline{D}$  is  $\mathsf{bu}^-(k)$  iff the steps of rewriting (modulo  $\mathcal{R}$ ) are meeting the conditions of the usual  $\mathsf{bu}^-(k)$  condition (note that no condition is required on the steps of rewriting (modulo  $\mathcal{A}$ )).

**Lemma 4.48.** Let  $\overline{D}$  be a derivation of the form (65-67). If  $\overline{S}$  is a cascade of exact level h w.r.t.  $\overline{D}$  and  $\overline{D}$  is  $bu^-(k)$ , then  $h \leq k$ .

Sketch of proof. Let  $\overline{D}$  be a derivation of the form (65-67). One can prove by induction over h the more general statement:

if  $\overline{S} = \overline{s\sigma}$  (where  $s \notin \mathcal{V}$ ) is a cascade of exact level h (with this decomposition) w.r.t.  $\overline{D}_i$  (for some i), and every internal node of  $\overline{s}$  has a mark  $\geq r$ , then there exists  $\lambda \geq 0$ , such that a mark  $\geq r + h - 1$  occurs in the occurrence  $\overline{l}_{i+\lambda}$  of lefthand-side of rule used in the  $i + \lambda$ -th step of  $\overline{D}$  (67).

Since  $\overline{D}$  is  $\mathsf{bu}^-(k)$ , a mark  $\geq k$  cannot occur in  $\overline{l}_{i+\lambda}$ , hence no cascade  $\overline{S}$  w.r.t.  $\overline{D}$  can have an exact level  $\geq k+1$ .

## Proof of lemma 4.36:

Let  $\overline{s}, \overline{t} \in \mathcal{T}(\mathcal{F}^{\leq k}), q \in \mathbb{Q}^0, n \in \mathbb{N}$ , such that

$$\overline{s}_{k} \circ \to_{\mathcal{R}}^{n} \overline{t}$$
 (71)

is  $\mathsf{bu}^-(k)$ ,  $\overline{s}$  is tm-increasing and  $\overline{t} \to_{\mathcal{A}}^* q$ .

By Lemma 4.44 all the marked terms in derivation (71) are tm-increasing. Let us notice that q is a bunch of cascades for the derivation of null length starting on q. Using inductively Lemma 4.45, we obtain a term  $\overline{s}'$  and derivations

$$\overline{s} \to_{\mathcal{A}}^* \overline{s'}$$

 $\overline{D}: \overline{s'} = \overline{t'_0}_k \circ_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t'_1}_k \circ_{\mathcal{R}} \to_{\mathcal{A}}^* \cdots {}_k \circ_{\mathcal{R}} \overline{t'_i}_k \circ_{\mathcal{R}} \to_{\mathcal{A}}^* \cdots {}_k \circ_{\mathcal{R}} \to_{\mathcal{A}}^* \overline{t'_i} = q$  such that every  $\overline{t'_i}$  (for  $0 \leq i \leq \ell - 1$ ) is a bunch of cascades for  $\overline{D}_i$ . By Lemma 4.48 every cascade w.r.t.  $\overline{D}_i$  has level  $\leq k$ . Hence the *i*-th step of  $k \circ_{\mathcal{R}}$  in derivation  $\overline{D}$  is a step for the relation  $\to_{\mathcal{S}_1}$ . It follows that  $\overline{D}$  is a derivation modulo  $(\mathcal{S}_1 \cup \to_{\mathcal{A}}).\Box$ 

Let us express an upper-bound on the complexity for the construction of the set of ancestors of a recognizable set of terms. (Recall the number  $A(\mathcal{R})$  was introduced in §2.4).

**Theorem 4.49.** Let  $k \geq 2$ , let  $(\mathcal{R}, \mathcal{F})$  be a finite rewriting system in  $\mathsf{BU}^-(k)$ , with  $\mathsf{A}(\mathcal{R}) \geq 1$  and  $\mathcal{A}$  be some f.t.a over  $\mathcal{F}$  recognizing a language T. One can compute a f.t.a  $\mathcal{B}$  recognizing  $(\to_{\mathcal{R}}^*)[T]$  in time polynomial w.r.t.

$$\|\mathcal{R}\|^{k\cdot(\mathsf{A}(\mathcal{R}))^{k-1}}\cdot\|\mathcal{A}\|^{(\mathsf{A}(\mathcal{R}))^k}.$$

Note that:

- for systems with  $k \leq 1$ , the complexity is analyzed in Theorem 4.32
- for systems with  $k \geq 2$  and  $A(\mathcal{R}) = 0$ , i.e. ground systems, the complexity is covered by Theorem 4.31.

Sketch of proof.;

**Step 1**: Let us assume  $\mathcal{R}$  is variable-free (we recall it means that it has no variable left-handside nor right-handside).

By Lemma 4.35 and Lemma 4.36

$$({}_{k} \rightarrow_{\mathcal{R}}^{*})[T] = (\rightarrow_{\mathcal{S}_{1}^{0} \cup \mathcal{A}}^{*})[Q_{f}] \cap \mathcal{T}(\mathcal{F})$$

The construction of  $\mathcal{B}$  consists in computing the ground system  $\mathcal{S}_1^0$  (obtained by erasing the marks in the system  $\mathcal{S}_1$  introduced by Definition 4.33), to apply the construction of Theorem 4.31 and, finally, to perform a direct product with a f.t.a recognizing  $\mathcal{T}(\mathcal{F})$ .

The set of possible substitutions  $\tau_1, \ldots, \tau_i, \tau_{k-1}$  in Definition 4.33 has cardinality less or equal to

$$\|\mathcal{R}\|^{\mathsf{A}(\mathcal{R})+\mathsf{A}^2(\mathcal{R})+\ldots+\mathsf{A}^{k-1}(\mathcal{R})}$$

(within this subsubsection, for every integer  $m \geq 0$ , we denote by  $A^m(\mathcal{R})$  the integer  $(A(\mathcal{R}))^m$ ; this removal of parenthese should not lead to any ambiguity since the operation  $\mathcal{R} \mapsto A(\mathcal{R})$  cannot be iterated). The set of possible final substitutions  $\tau_k$  has cardinality less or equal to

$$\|\mathcal{A}\|^{\mathsf{A}^k(\mathcal{R})}$$

Since the number of rules of  $\mathcal{R}$  is less or equal than  $\|\mathcal{R}\|$  we get an upper-bound for the number of rules of  $\mathcal{S}_1^0$ :

$$\operatorname{Card}(\mathcal{S}_1^0) \le \|\mathcal{R}\|^{1+\operatorname{A}(\mathcal{R})+\operatorname{A}^2(\mathcal{R})+\ldots+\operatorname{A}^{k-1}(\mathcal{R})} \cdot \|\mathcal{A}\|^{\operatorname{A}^k(\mathcal{R})} \tag{72}$$

For every rule  $\ell_1 \to r_1 \in \mathcal{S}_1^0$ , since  $\ell_1 = \ell(\tau_1 \cdots \circ \tau_i \cdots \circ \tau_{k-1} \circ \tau_k)$  and  $r_1 = r(\tau_1 \cdots \circ \tau_i \cdots \circ \tau_{k-1} \circ \tau_k)$  for some  $\ell \to r \in \mathcal{R}$ , and for every variable

 $v \in \mathcal{V}, |\tau_i(v)| \leq ||\mathcal{R}||, \text{ we have}$ 

$$|\ell_1| + |r_1| \leq \|\mathcal{R}\| \cdot (1 + \mathsf{A}(\mathcal{R}) + \mathsf{A}^2(\mathcal{R}) + \dots + \mathsf{A}^{k-1}(\mathcal{R}))$$
  
$$\leq \|\mathcal{R}\| \cdot k \cdot \mathsf{A}^{k-1}(\mathcal{R})$$
 (73)

Multiplying the upper-bound for the number of rules by the upper-bound for the size of each rule, we obtain

$$\|\mathcal{S}_{1}^{0}\| \leq \|\mathcal{R}\|^{1+\mathsf{A}(\mathcal{R})+\mathsf{A}^{2}(\mathcal{R})+\ldots+\mathsf{A}^{k-1}(\mathcal{R})} \cdot \|\mathcal{A}\|^{\mathsf{A}^{k}(\mathcal{R})} \cdot |\mathcal{R}\| \cdot k \cdot \mathsf{A}^{k-1}(\mathcal{R})$$

$$\leq \|\mathcal{R}\|^{4 \cdot k \cdot \mathsf{A}^{k-1}(\mathcal{R})} \cdot \|\mathcal{A}\|^{\mathsf{A}^{k}(\mathcal{R})}. \tag{74}$$

(we assume that  $\mathcal{R} \neq \emptyset$  hence that  $2 \leq ||\mathcal{R}||$  in the above majorization: for  $\mathcal{R} = \emptyset$ , anyway, the computation of  $\mathcal{B}$  consists of taking  $\mathcal{B} := \mathcal{A}$ , which takes no time ). The construction of the system  $\mathcal{S}_1^0$  is straightforward, thus takes a time polynomial in  $||\mathcal{S}_1^0||$ . The computation, from  $\mathcal{A}$  and  $\mathcal{S}_1^0$ , of a f.t.a  $\mathcal{A}'$  recognizing  $(\to_{\mathcal{S}_1^0 \cup \mathcal{A}}^*)[Q_f]$  takes a time polynomial in  $||\mathcal{A}|| + ||\mathcal{S}_1^0||$  by Theorem 4.31. By inequality (74),  $||\mathcal{A}|| + ||\mathcal{S}_1^0|| \leq ||\mathcal{R}||^{5 \cdot k \cdot A^{k-1}(\mathcal{R})} \cdot ||\mathcal{A}||^{A^k(\mathcal{R})}$ , which is a polynomial in  $||\mathcal{R}||^{k \cdot A^{k-1}(\mathcal{R})} \cdot ||\mathcal{A}||^{A^k(\mathcal{R})}$ . Let  $\mathcal{F}' \subseteq \mathcal{F}$  be the subset of symbols that have at least one occurrence either in the transitions of  $\mathcal{A}$  or in the rules of  $\mathcal{R}$ . Finally,  $\mathcal{B}$  is obtained from  $\mathcal{A}'$  by performing the direct-product of  $\mathcal{A}'$  with a f.t.a recognizing  $\mathcal{T}(\mathcal{F}')$ . The overall computation of  $\mathcal{B}$  thus takes a time polynomial in  $|\mathcal{F}|' \cdot ||\mathcal{R}||^{k \cdot A^{k-1}(\mathcal{R})} \cdot ||\mathcal{A}||^{A^k(\mathcal{R})}$ . Since we assumed that  $k \geq 2$ ,  $A(\mathcal{R}) \geq 1$ ,  $||\mathcal{R}|| \geq 2$ , it is also a polynomial in

$$\|\mathcal{R}\|^{k\cdot\mathsf{A}^{k-1}(\mathcal{R})}\cdot\|\mathcal{A}\|^{\mathsf{A}^{k}(\mathcal{R})}.$$

Step 2: Let  $\mathcal{R}$  be a general TRS (whith, possibly, some variable lhs or rhs). The transformation  $\mathcal{R} \mapsto \mathcal{R}_1$  defined in §4.2.1, is a polynomial reduction of the general case to the subcase treated in step 1 of this proof (see Lemma 4.22).

Note that, for every fixed parameters  $k \geq 1$  and  $A(\mathcal{R})$ , the construction of the set of ancestors of a rational set for some TRS  $\mathcal{R}$  in  $BU^-(k)$  can be achieved in polynomial time. In general, for a fixed  $A(\mathcal{R})$  and variable k, the dependency in k is double exponential. In the case of unary terms we get only an exponential complexity.

**Corollary 4.50.** Let  $k \geq 2$ , let  $\mathcal{F}$  be a signature with symbols of arity  $\leq 1$ , let  $\mathcal{A}$  be some f.t.a recognizing a language  $T \subseteq \mathcal{T}(\mathcal{F})$  and let  $\mathcal{R}$  be a finite

rewriting system in  $BU^{-}(k)$ . One can compute a f.t.a  $\mathcal{B}$  recognizing  $(\to_{\mathcal{R}}^{*})[T]$  in time polynomial w.r.t.

$$\|\mathcal{R}\|^k \cdot \|\mathcal{A}\|.$$

*Proof.* If  $A(\mathcal{R}) = 1$ , just replace  $A(\mathcal{R})$  by the integer 1 in the conclusion of Theorem 4.49. If  $A(\mathcal{R}) = 0$ , the result follows from Theorem 4.31.

#### 4.3.3. Lower-bound

We show here that, there exists a fixed signature  $\mathcal{F}$  and two fixed recognizable sets  $L_1, L_2$  over  $\mathcal{F}$  such that, the accessibility from  $L_1$  to  $L_2$  for a rewriting system in  $\mathsf{BU}^-(1)$  is NP-hard. This shows that the upper-bound given by Theorem 4.49 in the case of a fixed parameter k, which is exponential w.r.t.  $\mathsf{A}(\mathcal{R})$ , cannot presumably be significantly improved.

Let us fix the signature  $\mathcal{F} := \{f, g, \wedge, \vee, \neg, 0, 1\}$  where the arities are 2, 2, 2, 2, 1, 0, 0 (for the symbols in the given ordering). We shall also use the subsignature  $\mathcal{F}' := \mathcal{F} \setminus \{f, g\}$ . Let us consider the regular term-grammar  $\mathcal{G}$ , over the signature  $\mathcal{F}$ , with non-terminals  $T_0, T_1, T_2, G_0, G_1, G$  and with set of rules:

$$T_1 \rightarrow 1$$

$$T_2 \rightarrow f(T_2, G) + 2$$

$$G_0 \rightarrow g(G_0, 0) + 0$$

$$G_1 \rightarrow g(G_1, 1) + 1$$

$$G \rightarrow G_0 + G_1$$

For sets of terms  $L_1, L_2$  we abbreviate by  $L_1 \to_{\mathcal{R}}^* L_2$  the sentence  $\exists t_1 \in L_1, \exists t_2 \in L_2, t_1 \to_{\mathcal{R}}^* t_2$ .

**Theorem 4.51.** The problem to decide, for a given linear term rewriting system  $(\mathcal{R}, \mathcal{F})$  in  $\mathsf{BU}^-(1)$ , whether  $\mathsf{L}(\mathcal{G}, T_1) \to_{\mathcal{R}}^* \mathsf{L}(\mathcal{G}, T_2)$ , is NP-hard.

We reduce, in P-time, the problem 3-SAT to the above problem. Let  $\varphi$  be some propositional formula in 3-Conjunctive Normal Form:  $\varphi$  is a formula with  $n_v$  variables  $x_1, x_2, \ldots, x_{n_v}$  of the form

$$\varphi = \bigwedge_{k=1}^{n_c} \bigvee_{\ell=1}^{3} v_{k,\ell}^{\varepsilon_{k,\ell}}$$

where  $n_c \in \mathbb{N}, v_{k,\ell} \in \{x_1, x_2, \dots, x_{n_v}\}, \ \varepsilon_{k,\ell} \in \{-1, +1\}$  with the convention that  $v^{+1}$  (resp.  $v^{-1}$ ) denotes v (resp.  $\neg v$ ). Let us note that, if every variable

occurs in at least one clause and if all the clauses of  $\varphi$  are distinct, then  $n_v \leq 3n_c \leq 24n_v$ . Hence, after some mild normalization (either adding variables that do not occur in any clause or adding copies of a clause that already occurs, which can be achieved in P-time),  $\varphi$  can be put in the form of a formula with n variables  $x_1, x_2, \ldots, x_n$  and n clauses:

$$\varphi = \bigwedge_{k=1}^{n} \bigvee_{\ell=1}^{3} v_{k,\ell}^{\varepsilon_{k,\ell}} \tag{75}$$

where  $n \in \mathbb{N}, v_{k,\ell} \in \{x_1, x_2, \dots, x_n\}, \varepsilon_{k,\ell} \in \{-1, +1\}$ . Let us define a kind of linearization of  $\varphi$  over a set of  $3n^2$  new variables  $x_{i,j}$ , for  $1 \le i \le n, 1 \le j \le 3n$ .

$$\hat{\varphi} := \bigwedge_{k=1}^{n} \bigvee_{\ell=1}^{3} \hat{v}_{k,\ell}^{\varepsilon_{k,\ell}} \tag{76}$$

where  $\hat{v}_{k,\ell} := x_{i,j}$  iff  $(v_{k,\ell} = x_i \text{ and } \mathsf{Card}\{(k',\ell') \in [1,n]^2 \mid (k',\ell') \leq_{lex} (k,\ell) \& v_{k',\ell'} = v_{k,\ell}\} = j)$ . In words:  $\hat{v}_{k,\ell} := x_{i,j}$  when the meta-variable  $v_{k,\ell}$  denotes the variable  $x_i$  and it is exactly the j-th occurrence (from left to right) of  $x_i$  in formula (75). Note that  $\hat{\varphi}$  is linear and

$$\varphi = \hat{\varphi}\sigma \tag{77}$$

for the substitution

$$\sigma: x_{i,j} \mapsto x_i. \tag{78}$$

Let us denote by  $x_{i,*}$  the sequence of 3n variables  $x_{i,1}, \ldots, x_{i,3n}$  and by  $x_{*,*}$  the sequence of  $3n^2$  variables  $x_{1,1}, \ldots, x_{i,j}, x_{i,j+1}, \ldots, x_{n,3n}$ . We define three sequences of terms  $(f_m)_{m\geq 1}, (g_m)_{m\geq 1}, (h_m)_{m\geq 1}$  by the following recurrence relations:

$$f_1(x_1) := x_1, \quad f_{m+1}(x_1, x_2, \dots, x_{m+1}) := f(f_m(x_1, x_2, \dots, x_m), x_{m+1}),$$

$$g_1(x_1) := x_1, \quad g_{m+1}(x_1, x_2, \dots, x_{m+1}) := g(g_m(x_1, x_2, \dots, x_m), x_{m+1}),$$

$$h_m(x_{*,*}) := f_{m+1}(2, g_{3m}(x_{1,*}), \dots, g_{3m}(x_{i,*}), \dots, g_{3m}(x_{m,*})).$$

We define a fixed ground rewriting system  $\mathcal{PL}$  consisting of the rules allowing to evaluate a Boolean formula, taken in reverse order:

$$\begin{split} 0 &\to 0 \land 0, \quad 0 \to 0 \land 1, \quad 0 \to 1 \land 0, \quad 1 \to 1 \land 1, \\ 0 &\to 0 \lor 0, \quad 1 \to 0 \lor 1, \quad 1 \to 1 \lor 0, \quad 1 \to 1 \lor 1, \\ 1 &\to \neg 0, \quad 0 \to \neg 1. \end{split}$$

(The initials  $\mathcal{PL}$  intend to make the reader think of "Propositional Logic"). We define the *special* rule associated with  $\varphi$  by:

$$\hat{\varphi}(x_{*,*}) \to h_n(x_{*,*}) \tag{79}$$

where  $\hat{\varphi}$  is some term over  $\mathcal{F}$  expressing the Boolean formula  $\hat{\varphi}$  (the *n*-ary meta-symbol  $\bigwedge$  can be translated as a left-comb with internal nodes labelled by the binary symbol  $\bigwedge$  and similarly for the ternary symbol  $\bigvee$ ). We finally define the system  $(\mathcal{F}, \mathcal{R}_{\varphi})$ , associated with  $\varphi$ , by:

$$\mathcal{R}_{\varphi} := \mathcal{PL} \cup \{ \hat{\varphi}(x_{*,*}) \to h_n(x_{*,*}) \}.$$

We cut into several lemmas the proof that  $\varphi \mapsto \mathcal{R}_{\varphi}$  is a valid reduction.

**Lemma 4.52.** For every 
$$b_1, b_2, \ldots b_n, b \in \{0, 1\}, b \to_{\mathcal{PL}}^* \varphi(b_1, b_2, \ldots, b_n)$$
 iff  $b \to_{\mathcal{R}_{\varphi}}^* f_{n+1}(2, g_{3n}(b_1, b_1, \ldots, b_1), g_{3n}(b_2, b_2, \ldots, b_2), \ldots, g_{3n}(b_n, b_n, \ldots, b_n)).$ 

*Proof.* Using the special rule (79) we get:

$$\hat{\varphi}\tau \to_{\mathcal{R}_{\varphi}} f_{n+1}(2, g_{3n}(b_1, b_1, \dots, b_1), g_{3n}(b_2, b_2, \dots, b_2), \dots, g_{3n}(b_n, b_n, \dots, b_n))$$
(80)

where the substitution  $\tau$  is defined by  $\tau(x_{i,j}) := b_i$ . We can factorize  $\tau$  as  $\tau := \sigma \circ \theta$  where  $\sigma$  was defined in (78) and  $\theta(x_i) := b_i$ . The one-step rewriting (80) thus can be seen as

$$(\hat{\varphi}\sigma)\theta \to_{\mathcal{R}_{\varphi}} f_{n+1}(2, g_{3n}(b_1, b_1, \dots, b_1), g_{3n}(b_2, b_2, \dots, b_2), \dots, g_{3n}(b_n, b_n, \dots, b_n))$$

which, by the identity (78) shows that

$$\varphi(b_1, b_2, \dots, b_n) = \varphi\theta \to_{\mathcal{R}_{\varphi}} f_{n+1}(2, g_{3n}(b_1, b_1, \dots, b_1), g_{3n}(b_2, b_2, \dots, b_2), \dots, g_{3n}(b_n, b_n, \dots, b_n)).$$

The lemma follows easily from this last relation.

**Lemma 4.53.** The following two conditions are equivalent:

$$1-\{1\} \to_{\mathcal{R}_{\varphi}}^* \mathsf{L}(\mathcal{G}, T_2)$$

2- There exist  $b_1, b_2, \dots b_n \in \{0, 1\}$ , such that:

$$1 \to_{\mathcal{R}_{\varphi}}^* f_{n+1}(2, g_{3n}(b_1, b_1, \dots, b_1), g_{3n}(b_2, b_2, \dots, b_2), \dots, g_{3n}(b_n, b_n, \dots, b_n)).$$

*Proof.* 1- Suppose condition 1 holds: there exists  $t_2 \in \mathsf{L}(\mathcal{G}, T_2)$  such that  $1 \to_{\mathcal{R}_{\varphi}}^* t_2$ . Since no rule of  $\mathcal{PL}^{-1}$  can be applied on  $t_2$ , the derivation must decompose as

$$1 \to_{\mathcal{R}_{\varphi}}^* t_2' \to_{\mathcal{R}_{\varphi}} t_2$$

where the last step uses the special rule (79). Note that  $t_2$  has exactly one occurrence of the constant 2 while  $t'_2$  has no occurrence of this symbol. Since  $1 \to_{\mathcal{R}_{\varphi}}^* t'_2$ , the term  $t'_2$  must belong to  $\mathcal{T}(\mathcal{F}')$ . This implies that the contractum in  $t_2$  was  $t_2$  itself:

$$t_2 := h_n(x_{*,*})\tau$$

for some substitution  $\tau: \{x_{i,j} \mid 1 \leq i \leq n, 1 \leq j \leq 3n\} \to \mathcal{T}(\mathcal{F}')$ . From the fact that  $t_2 \in \mathsf{L}(\mathcal{G}, T_2)$  we deduce that,  $\forall i \in [1, n], \exists b_i \in \{0, 1\},$ 

$$\tau(x_{i,1}) = \tau(x_{i,2}) = \ldots = \tau(x_{i,3n}) = b_i.$$

Hence  $t_2 = f_{n+1}(2, g_{3n}(b_1, b_1, \dots, b_1), g_{3n}(b_2, b_2, \dots, b_2), \dots, g_{3n}(b_n, b_n, \dots, b_n))$  and condition 2 holds.

2- Suppose condition 2 holds. Since the last term of this derivation belongs to  $L(\mathcal{G}, T_2)$ , condition 1 holds.

For every marked term  $\overline{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$ , we call a path  $P' \subseteq \mathcal{P}os(\overline{t})$  a  $\mathcal{F}'$ -path iff all the labels of P' belong to  $\mathcal{F}'$ . Let us consider the following property  $\mathsf{PR}(\overline{s})$  of a term  $\overline{s} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$ :

$$\forall P' \subseteq \mathcal{P}os(s)$$
, if  $(P' \text{ is a } \mathcal{F}' - \text{path and } \mathsf{Min}\{\mathsf{m}(\overline{s}/u) \mid u \in P'\} = 0)$   
then  $\mathsf{Max}\{\mathsf{m}(\overline{s}/u) \mid u \in P'\} = 0$ . (81)

Every wbu rewriting-step of  $\hookrightarrow_{\mathcal{R}_{\varphi}}$  preserves PR in the following sense

**Lemma 4.54.** For every  $\overline{s}, \overline{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}})$  if  $(\mathsf{PR}(\overline{s}) \text{ and } \overline{s} \hookrightarrow_{\mathcal{R}_{\varphi}} \overline{t} \text{ is a wburewriting step})$ , then  $\mathsf{PR}(\overline{t})$ .

*Proof.* Let us consider a wbu rewriting step

$$\overline{s} = \overline{C}[\overline{l}\overline{\sigma}] \hookrightarrow_{\mathcal{R}_{\varphi}} \overline{C}[r\overline{\overline{\sigma}}] = \overline{t}.$$

- If the rule used belongs to  $\mathcal{PL}$ ,  $\overline{l} = b$  for some  $b \in \{0, 1\}$  and r is a term over  $\mathcal{F}'$  with only null marks; thus every  $\mathcal{F}'$ -path Q of  $\overline{t}$  must either be included in  $\overline{C}$  (case 1) or is obtained from a path Q' of  $\overline{s}$  by replacing its maximal

element (labelled by b) by two elements (labelled by symbols of  $\mathcal{F}'$ )(case 2). In case 1  $\mathsf{Max}\{\mathsf{m}(\overline{s}/u) \mid u \in Q\} = 0$  because this was true in  $\overline{s}$ . In case 2  $\mathsf{Max}\{\mathsf{m}(\overline{s}/u) \mid u \in Q\} = 0$  because the labels of Q' were null and the labels of the two new nodes are also null. Hence PR is preserved;

- If the special rule is used: since r has no label in  $\mathcal{F}'$ , every  $\mathcal{F}'$ -path Q of  $\overline{t}$  must be either included in  $\overline{C}$  (case 3) or included in  $x\overline{\overline{\sigma}}$  for some variable x of r (case 4). In case 3  $\operatorname{Max}\{\operatorname{m}(\overline{s}/u) \mid u \in Q\} = 0$  because this was true in  $\overline{s}$  and in case 4,  $\operatorname{Min}\{\operatorname{m}(\overline{s}/u) \mid u \in P'\} \geq 1$ . Hence PR is preserved.

**Lemma 4.55.** For every Boolean formula  $\varphi$ , the system  $\mathcal{R}_{\varphi}$  is linear and  $\mathsf{BU}^-(1)$ .

*Proof.* It is clear that  $\mathcal{R}_{\varphi}$  is linear. Let us consider a wbu marked derivation (modulo  $\mathcal{R}_{\varphi}$ ):  $s \hookrightarrow^n \overline{t} \hookrightarrow \overline{t'}$  with  $s \in \mathcal{T}(\mathcal{F})$ .

Let  $l \to r$  be the rule of  $\mathcal{R}_{\varphi}$  which is used in the last step of the associated unmarked derivation.

- If  $l \to r \in \mathcal{PL}$ , since the step is wbu, the root of l has a null mark and no other mark appears in l since it has depth 1;
- If  $l \to r$  is the special rule, since every branch of l is labelled by a word in  $\mathcal{F}'^*\mathcal{V}$  and  $\overline{t}$  fulfills PR, and  $\overline{l}$  has a root marked 0, all internal nodes of  $\overline{l}$  have the mark 0; hence  $\mathsf{mmax}(\overline{l}) = 0$ .

By induction over the integer n we can thus prove that, for every  $s \in \mathcal{T}(\mathcal{F})$ , every wbu marked derivation  $s \hookrightarrow^n \overline{t}$  is bu<sup>-</sup>(1).

Let us prove Theorem 4.51. By Lemmas (4.52-4.53)  $\varphi$  is satisfiable iff  $L(\mathcal{G}, T_1) \to_{\mathcal{R}_{\varphi}}^* L(\mathcal{G}, T_2)$ . Moreover  $\mathcal{R}_{\varphi}$  is computable in Polynomial time from  $\varphi$  and, by Lemma 4.55, it belongs to  $BU^-(1)$ . Hence  $\varphi \mapsto \mathcal{R}_{\varphi}$  is a Polynomial-time reduction of the satisfiability problem for Boolean formulas in 3-CNF to the problem under consideration.

#### 5. Testing the Bottom-up property

We investigate here the question whether the properties  $\mathsf{BU}(k)$  (resp.  $\mathsf{BU}^-(k)$ ) are decidable, or not. We concentrate first on the case of semi-Thue systems:

• we establish a criterium (i.e. a Necessary and Sufficient Condition) for the property  $\mathsf{BU}(k)$ , in the case of length-increasing semi-Thue systems (Proposition 5.6)

- we show that the property  $\mathsf{BU}(k)$  is decidable in some non-trivial subclass of length-increasing semi-Thue systems (Proposition 5.7) and that it is undecidable for general length-increasing semi-Thue systems (Theorem 5.11).
- we deduce the undecidability of the property BU(k) for term rewriting systems (Theorem 5.12).

# 5.1. A criterium for semi-Thue systems

More notation for derivations. The general notion of derivation which was given in  $\S 2.1$  for general binary relations  $\rightarrow$ , turns out not to be precise enough for an analysis in the case where the binary relation is defined through combinatorial means, as is the case for derivations induced by semi-Thue systems or term rewriting systems (see remark 2.3). We thus borrow from [8, 24] a more precise notion of derivation, some useful notation and a notion of equivalence over derivations.

We assume some semi-Thue system  $\mathcal{R}$  over an alphabet Y is given. For every rule  $R = l \to r$  and words  $v, w \in Y^*$ , we note  $\partial^+((v, R, w)) := vrw, \partial^-((v, R, w)) := vlw$ . We call derivation any non-empty sequence of triples of the form

$$D = ((v_1, R_1, w_1), \dots, (v_i, R_i, w_i), \dots, (v_n, R_n, w_n))$$
(82)

such that, for every  $1 \leq i \leq n-1$ ,  $\partial^+(v_i, R_i, w_i) = \partial^-(v_{i+1}, R_{i+1}, w_{i+1})$  and also the triples

$$D_v := (v, \mathsf{ID}, \varepsilon) \tag{83}$$

where ID is a special symbol that we view as the *Identity* rule. We extend the notations  $\partial^{\alpha}$  by defining for D given in (82):

$$\partial^{+}(D) := \partial^{+}(v_n, R_n, w_n), \ \partial^{-}(D) := \partial^{-}(v_1, R_1, w_1)$$

and for  $D_v$  given in (83):

$$\partial^+(D_v) := v, \ \partial^-(D_v) := v.$$

We define an equivalence  $\approx$  on derivations by

$$D \approx D' \Leftrightarrow (\partial^+(D) = \partial^+(D') \& \partial^-(D) = \partial^-(D'))$$

i.e. D, D' are equivalent when they have same starting word and same ending word. The length  $\ell(D)$  is defined as n for the derivation (82) and 0 for the derivation (83). Given derivations D, D' such that  $\partial^+(D) = \partial^-(D')$ , their composition  $D \otimes D'$  is just their concatenation (when they both have non-null length), D when  $\ell(D') = 0$ , and D' when  $\ell(D) = 0$ .

The words of  $Y^*$  act on the right and on the left over derivations: for D defined by (82) we set

$$D \cdot v := ((v_1, R_1, w_1 v) \dots, (v_i, R_i, w_i v), \dots, (v_n, R_n, w_n v))$$

and  $v \cdot D$  is defined similarly;  $D_u \cdot v := D_{uv}$  and  $v \cdot D_u := D_{vu}$ . One can easily check that, for every derivations D, D', F, F', words u, v and signs  $\alpha \in \{+1, -1\}$ :

$$u(D \otimes D')v = uDv \otimes uD'v,$$
 
$$\partial^{\alpha}(uDv) = u\partial^{\alpha}(D)v,$$
 
$$\partial^{+}(D \otimes D') = \partial^{+}(D'), \ \partial^{-}(D \otimes D') = \partial^{-}(D).$$

From these formulas it follows easily that,

$$(D \approx D' \& F \approx F') \Rightarrow D \otimes F \approx D' \otimes F'$$
  
 $D \approx D' \Rightarrow uDv \approx uD'v.$ 

These two last *compatibility* properties will be widely (though implicitly) used in our proofs. We call a derivation D right-minimal (r-minimal, for short) iff its only decomposition as  $D = D' \cdot v'$  is the trivial one:  $D' = D, v' = \varepsilon$ .

Some basic properties. Let  $\mathcal{R}$  be any semi-Thue system over some alphabet Y.

**Lemma 5.1.** For every derivation D and word  $u \in Y^*$ , D is bu(k) iff  $D \cdot u$  is bu(k).

Sketch of proof.  $\Leftarrow$  is clear.

 $\Rightarrow$ : In the marked derivation, w.r.t  $\hat{\mathcal{R}}$  (see §2.5), associated with D, the letter # has marks in [0,k]. In the marked derivation (w.r.t  $\hat{\mathcal{R}}$ ) associated with  $D \cdot u$ , all the positions of the suffix u# will have the same mark which is the same integer as before, hence belongs to [0,k].

**Lemma 5.2.** For every derivations  $D_1, D_2$ , if  $D_1 \otimes D_2$  is bu(k), then  $D_1$  and  $D_2$  are bu(k).

Sketch of proof. Suppose that  $D_1 \otimes D_2$  is  $\mathsf{bu}(k)$ . Let us set  $\ell(D_1) = \ell_1$ ,  $\ell(D_2) = \ell_2$ .

The fact that  $D_1$  is bu(k) too is straightforward.

For every  $i \in [0, \ell_2]$ , the mark of the *jth* position of the *ith* word of  $D_2$  is smaller than the mark of the *jth* position of the  $(\ell_1 + i)$ th word of  $D_1 \otimes D_2$ . Thus, the hypothesis ensures that all the marks of the marked derivation associated with  $D_2$  are in [0, k].

**Lemma 5.3.** For every derivations  $D_1, D_2$ , word  $u_1 \in Y^*$  and rule  $R_1 \in \mathcal{R}$ , if  $D_1 \otimes u_1 \cdot R_1$  is  $\mathsf{bu}(k)$  and  $D_2$  is  $\mathsf{bu}(k)$ , then  $D_1 \otimes u_1 \cdot R_1 \otimes D_2$  is  $\mathsf{bu}(k)$ .

Sketch of proof. The derivation  $D_1 \otimes u_1 \cdot R_1$  is  $\mathsf{bu}(k)$ , hence weakly bottomup. Hence all the positions of  $u_1$  in the lhs and rhs of the last step of this derivation have a null mark. All the positions of  $\partial^+(R_1)$  in the rhs of the last step also have a null mark, by definition of the marking process. Finally, the word  $\partial^+(D_1 \otimes u_1 \cdot R_1)$  has only null marks in the marked derivation (w.r.t.  $\hat{\mathcal{R}}$ ) associated with  $D_1 \otimes u_1 \cdot R_1$ . Let us consider the unique marked derivation  $\hat{D}$  (w.r.t.  $\hat{\mathcal{R}}$ ) associated with the derivation  $D_1 \otimes u_1 \cdot R_1 \otimes D_2$ :

$$\hat{D}: \bar{w}_0\#, \bar{w}_1\#^{m_1}, \dots, \bar{w}_n\#^{m_n}$$

- its part labelled over Y,  $(\bar{w}_0, \bar{w}_1, \ldots, \bar{w}_n)$  is obtained just by concatenating the corresponding marked derivation associated with  $D_1 \otimes u_1 \cdot R_1$  and the marked derivation associated with  $D_2$  (where the final letter # has been erased); in particular this proves that every step fulfils definition 3.7, hence that  $\hat{D}$  is wbu; it proves also that all the marks of the words  $\bar{w}_0, \bar{w}_1, \ldots, \bar{w}_n$  belong to [0, k];
- every mark  $m_p$ , for  $0 \le p \le \ell_1$ , where  $\ell_1 := \ell(D_1 \otimes u_1 \cdot R_1)$ , belongs to [0, k], because  $D_1 \otimes u_1 \cdot R_1$  is  $\mathsf{bu}(k)$ ;
- one can prove by induction over p, for  $\ell_1 \leq p \leq n$ , that every mark  $m_p$  belongs to [0, k]:  $m_{\ell_1} \in [0, k]$  and, if  $p > \ell_1$ ,  $m_p$  is the maximum of  $m_{p-1}$  and of the mark on the # in the corresponding word of the marked derivation (w.r.t.  $\hat{\mathcal{R}}$ ) associated with  $D_2$ .

Hence D is  $\mathsf{bu}(k)$ , which entails that  $D_1 \otimes u_1 \cdot R_1 \otimes D_2$  is  $\mathsf{bu}(k)$ .

Figure 16: A minimal k-right-overlap

A criterium.

**Definition 5.4** (Minimal right-overlap). Let  $k \geq 1$  and let  $\mathcal{R}$  be a semi-Thue system over some alphabet Y. Let us call minimal k-right-overlap a 7-tuple (D, R, R', u, v, u', w) such that D is a r-minimal derivation, R, R' are rules of  $\mathcal{R}$  and u, v, u', w are words in  $Y^*$ , fulfilling:

1-  $\partial^+(D) = \partial^-(uRv)$ ,

 $2- \partial^+(uRvw) = \partial^-(u'R'),$ 

 $3- D \otimes uRv \text{ is } \mathsf{bu}(k),$ 

 $4-0 < |w| \le |vw| < |\partial^{-}(R')|.$ 

The minimal k-right-overlap is said resolved iff there exists a bu(k) derivation  $D' \approx Dw \otimes uRvw \otimes u'R'$ .

(See Figure 16).

**Lemma 5.5.** Let  $k \geq 1$  and let  $\mathcal{R}$  be a length-increasing semi-Thue system over some alphabet Y. Let us suppose that all the minimal k-right-overlaps of  $\mathcal{R}$  are resolved.

Then, for every bu(k) derivation D, rule  $R' \in \mathcal{R}$  and words  $u', v' \in Y^*$ , if

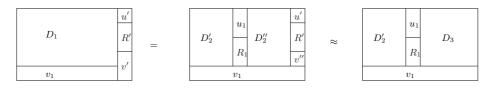

$$\partial^{+}(D) = \partial^{-}(u'R'v'), \tag{84}$$

then

there exists a 
$$bu(k)$$
 – derivation  $D' \approx D \otimes u'R'v'$ . (85)

*Proof.* We prove that every (D, R', u', v') fulfills the implication  $((84) \Rightarrow (85))$ , by Noetherian induction over the pair  $(|u'|, \ell(D))$ , using the lexicographic ordering on  $\mathbb{N} \times \mathbb{N}$ .

Let us consider some (D, R', u', v') such that D is  $\mathsf{bu}(k)$  and the hypothesis (84) holds. One of cases 0-3 below must occur (see Figures 17-18). case 0:  $\ell(D)=0$ 

Case 1

Figure 17: Adding one rule

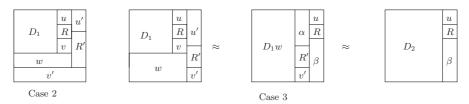

Figure 18: Adding one rule

In this case we can choose  $D' = D \otimes u'R'v' = u'R'v'$  which is bu(k).

case 1:  $\ell(D) \ge 1$ ,  $D = D_1 v_1$  where  $D_1$  is a right-minimal  $\mathsf{bu}(k)$ -derivation and  $|\partial^+(D_1)| \ge |\partial^-(u'R')|$ 

Since  $D_1$  has non-null length, is right-minimal and bu(k), it decomposes as

$$D_1 = D_2' \otimes u_1 R_1 \otimes D_2'' \tag{86}$$

and the assumed inequality on the boundaries implies that  $v' = v''v_1$  for some word v''. The tuple  $(D_2'', R', u', v'')$  fulfills hypothesis (84) and  $(|u'|, \ell(D_2'')) = (|u'|, \ell(D) - 1) < (|u'|, \ell(D))$ . By induction hypothesis, there exists some bu(k)-derivation  $D_3 \approx D_2'' \otimes u'R'v''$ . Let us choose

$$D' := (D_2' \otimes u_1 R_1 \otimes D_3) v_1.$$

Lemma 5.2 applied on decomposition (86) shows that  $D'_2 \otimes u_1 R_1$  is  $\mathsf{bu}(k)$ . By Lemma 5.3  $D'_2 \otimes u_1 R_1 \otimes D_3$  is  $\mathsf{bu}(k)$  and by Lemma 5.1 we get that  $(D'_2 \otimes u_1 R_1 \otimes D_3)v_1$  is  $\mathsf{bu}(k)$ . Hence D' is a  $\mathsf{bu}(k)$  derivation such that  $D' \approx D$ 

case 2:  $D = (D_1 \otimes uRv)wv'$  where  $D_1$  is a right-minimal  $\mathsf{bu}(k)$ -derivation and  $0 < |w| \le |vw| < |\partial^-(R')|$ .

The 7-tuple  $(D_1, R, R', u, v, u', w)$  is a minimal k-right-overlap, hence it is resolved: there exists a  $\mathsf{bu}(k)$  derivation  $D_2 \approx D_1 w \otimes u R v w \otimes u' R'$ . Choosing  $D' := D_2 v'$  we obtain the conclusion (85).

case 3:  $D = (D_1 \otimes uRv)w$  where  $D_1$  is a right-minimal bu(k)-derivation and  $|u\partial^-(R)| \leq |u'|$ .

The inequality on the boundaries implies that "R and R' can be exchanged" i.e. that there exists words  $\alpha, \beta \in Y_1^*$  such that  $uRvw \otimes u'R'v' \approx \alpha R'v' \otimes uR\beta$ . Thus

$$(D_1 \otimes uRv)w \otimes u'R'v' \approx D_1w \otimes \alpha R'v' \otimes uR\beta. \tag{87}$$

Note that, as every rule of  $\mathcal{R}$  is length-increasing,  $|\alpha| \leq |u'|$ . The 4-tuple  $(D_1w, R', \alpha, v')$  fulfills hypothesis (84), and  $(|\alpha|, \ell(D_1w)) < (|u'|, \ell(D))$ . By induction hypothesis there exists a bu(k)-derivation

$$D_2 \approx D_1 w \otimes \alpha R' v'. \tag{88}$$

The 4-tuple  $(D_2, R, u, \beta)$  fulfills hypothesis (84), and  $(|u|, \ell(D_2)) < (|u'|, \ell(D))$  (because |u| < |u'|). By induction hypothesis there exists a  $\mathsf{bu}(k)$ -derivation

$$D' \approx D_2 \otimes uR\beta. \tag{89}$$

Combining the hypothesis of case 3 with equivalences (87)(88)(89) we obtain that  $D' \approx D \otimes u'R'v'$ , as required. In all cases we have proved the announced implication:

$$((84) \Rightarrow (85))$$

**Proposition 5.6.** Let  $k \geq 1$  and let  $\mathcal{R}$  be a length-increasing semi-Thue system over some alphabet Y. The system  $\mathcal{R}$  is  $\mathsf{BU}(k)$  iff all its minimal k-right-overlaps are resolved.

*Proof.*  $(\Rightarrow)$ 

Suppose that  $\mathcal{R}$  is a semi-Thue system over some alphabet Y and that it is  $\mathsf{BU}(k)$ . Since *every* derivation must be equivalent to some  $\mathsf{bu}(k)$  derivation, it is clear that every minimal k-right-overlap is resolved.

 $(\Leftarrow)$ 

Let  $\mathcal{R}$  have all its minimal k-right-overlaps resolved. Let us prove, by induction over  $\ell(D)$ , that, for every derivation D, there exists some  $\mathsf{bu}(k)$  derivation  $D' \approx D$ .

Basis:  $\ell(D) = 0$ .

In this case D is bu(k), hence we can choose D' = D.

Induction step:  $\ell(D) = n + 1$  for some  $n \ge 0$ .

D has a decomposition of the form:

$$D = D_1 \otimes u'R'v'$$

for some derivation  $D_1$ , with length  $\ell(D_1) = n$ , some rule  $R' \in \mathcal{R}$  and some words  $u', v' \in Y^*$ . By induction hypothesis, there exists some  $\mathsf{bu}(k)$ -derivation  $D_1'$  such that

$$D_1 \approx D_1'$$
.

By Lemma 5.5, there exists some bu(k)-derivation D' such that

$$D' \approx D'_1 \otimes u'R'v'.$$

It follows that  $D \approx D'$ , as required.

5.2. Decidable/undecidable cases for semi-Thue systems A decidable case.

**Proposition 5.7.** Let  $k \ge 1$ . The property BU(k) (resp.  $BU^-(k)$ ) is decidable for length-increasing semi-Thue systems fulfilling the additional condition below:

**C**:  $\mathcal{R}$  has no right-linear recursion i.e. there is no finite sequence of rules  $(l_i \to r_i)_{1 \le i \le n}$  such that, for every  $1 \le i \le n-1$ ,  $l_{i+1}$  is a suffix of  $r_i$ ,  $n \ge 2$  and  $l_1 = l_n$ .

*Proof.* (sketch)

Let  $\mathcal{R}$  be a length-increasing semi-Thue system fulfilling condition  $\mathbf{C}$ . By proposition 5.6 a necessary and sufficient condition for  $\mathcal{R}$  to be  $\mathsf{BU}(k)$  is that all its minimal k-right-overlaps are resolved. By condition  $\mathbf{C}$  this set of minimal k-right-overlaps is finite and constructible. Hence the above necessary and sufficient condition is testable.

Undecidable cases. We treat first the case of the property BU(1).

**Proposition 5.8.** It is undecidable whether a finite length-increasing semi-Thue system  $\mathcal{R}$  is  $\mathsf{BU}(1)$  (resp.  $\mathsf{BU}^-(1)$ ). Our proof will use the following variant of the universality problem for context-free grammars:

**Input**: A context-free grammar  $G = \langle Z, N, P \rangle$  where  $Z = \{z_1, z_2\}$  is the terminal alphabet, n is a strictly positive integer,  $N = \{S_1, \ldots, S_n\}$  is the non-terminal alphabet and  $P \subseteq N \times \mathcal{P}((Z \cup N)^+)$  is the finite set of rules.

Question:  $\forall s \in Z^*, S_1 \to_P^* sS_1$ ?

We call this problem the Modified Universality Problem (MUP in short). It follows easily from the undecidability of the classical universality problem for context-free grammars ([20, Theorem 8.11 p. 203]) that the above problem is undecidable.

Let us consider an instance G of MUP. We introduce some fresh symbols  $S_0, a_1, b$  not in  $Z \cup N$  and define the alphabet  $Y_1 := Z \cup N \cup \{S_0, a_1, b\}$ . Let  $\mathcal{R}$  be the semi-Thue system over  $Y_1$  whose set of rules consists of the union of P with the three new rules:

$$S_0 \to z_1 S_0, \ S_0 \to z_2 S_0, \ S_0 a_1 \to S_1 a_1.$$

We call  $R_{z1}$ ,  $R_{z2}$ ,  $R_{01}$  (in the above enumeration order) these new rules. We decompose in two lemmas the proof that  $G \mapsto \mathcal{R}$  is a reduction of MUP to the problem whether a semi-Thue system is BU(1).

**Lemma 5.9.** If  $\mathcal{R}$  is BU(1), then, for every  $s \in \mathbb{Z}^*$ ,  $S_1 \to_P^* sS_1$ .

*Proof.* Suppose  $\mathcal{R}$  is  $\mathsf{BU}(1)$ . Let  $s \in \mathbb{Z}^*$ . Consider the following derivation:

$$S_0 a_1 b \rightarrow_{\mathcal{R}}^* s S_0 a_1 b$$
 using  $R_{z1}, R_{z2}$   
 $\rightarrow_{\mathcal{R}} s S_1 a_1 b$  using  $R_{01}$ .

The associated marked derivation is

$$S_0 a_1 b \rightarrow_{\mathcal{R}}^* s S_0 a_1^1 b^1$$
  
 $\rightarrow_{\mathcal{R}} s S_1 a_1 b^2.$ 

The only possible bu(1) derivation with same boundary in the system  $\mathcal{R}$  would be the composition of the first step

$$S_0 a_1 b \rightarrow_{\mathcal{R}} S_1 a_1 b$$
 using  $R_{01}$ 

with a derivation

$$S_1 \to_P^* sS_1 \tag{90}$$

in the right-context  $a_1b$ . The existence of derivation (90) is thus ensured.  $\square$ 

**Lemma 5.10.** If for every  $s \in Z^*$ ,  $S_1 \to_P^* sS_1$ , then  $\mathcal{R}$  is  $\mathsf{BU}(1)$ .

*Proof.* Let us suppose that

$$\forall s \in Z^*, S_1 \to_P^* sS_1. \tag{91}$$

Let us consider some minimal 1-right-overlap (D, R, R', u, v, u', w) of the system  $\mathcal{R}$ . The only possible value for R' is  $R_{01}$  while R might be either  $R_{z1}$  or  $R_{z2}$ . It follows that  $w = a_1$  and  $v = \varepsilon$ . Since  $D \otimes uRv$  is  $\mathsf{bu}(1)$ , it has the form

$$D \otimes uRv : S_0 \to_P^* sS_0$$

for some  $s \in \mathbb{Z}^+$ . Hence

$$Dw \otimes uRvw \otimes u'R' : S_0a_1 \to_P^* sS_0a_1 \to_{R_{01}} sS_1a_1.$$

By hypothesis (91) there exists also a derivation  $D_1$  of the form  $D_1: S_1 \to_P^* sS_1$ . Let us choose

$$D':=R_{01}\otimes D_1.$$

Since  $D': S_0a_1 \to_{\mathcal{R}}^* sS_1a_1$  is  $\mathsf{bu}(1)$ , the only minimal right-overlap is resolved. By Proposition 5.6, it follows that  $\mathcal{R}$  is  $\mathsf{BU}(1)$ .

Let us prove now Proposition 5.8.

*Proof.* By Lemma 5.9 and Lemma 5.10,  $G \mapsto \mathcal{R}$  is a many-one reduction of MUP to the problem whether a finite length-increasing semi-Thue system is BU(1) or not. This last problem is thus undecidable.

We treat now the case of BU(k) for an arbitrary  $k \geq 1$ .

**Theorem 5.11.** For every  $k \ge 1$ , it is undecidable whether a finite length-increasing semi-Thue system  $\mathcal{R}$  is  $\mathsf{BU}(k)$  (resp.  $\mathsf{BU}^-(k)$ ) or not.

(Note that for semi-Thue systems, since every variable of a lhs of rule must appear in the corresponding rhs, the properties  $\mathsf{BU}(k)$ ,  $\mathsf{BU}^-(k)$  are equivalent).

*Proof.* (sketch) Let  $k \geq 1$ . Given an instance G of MUP, we construct an alphabet  $Y_k := Z \cup N \cup \{S_{0,1}, \ldots, S_{0,k}, a_1, a_2, \ldots, a_k, b\}$ , and a semi-Thue system  $\mathcal{R}$  over  $Y_k$  consisting of the union of P with the two new rules :

$$S_{0.1} \rightarrow z_1 S_{0.1}, S_{0.1} \rightarrow z_2 S_{0.1},$$

and the k additional rules:

$$S_{0,1}a_1 \to S_{0,2}a_1, \quad S_{0,2}a_1a_2 \to S_{0,3}a_1a_2, \dots, \quad S_{0,k}a_1a_2 \cdots a_k \to S_1a_1a_2 \cdots a_k.$$

One can check, by arguments similar to those used in the proof of Proposition 5.8 that  $\mathcal{R}$  is  $\mathsf{BU}(k)$  iff  $\forall s \in Z^*, S_1 \to_P^* sS_1$ . Hence the property  $\mathsf{BU}(k)$  is undecidable.

### 5.3. Undecidability for term rewriting systems

**Theorem 5.12.** For every  $k \geq 1$ , the problem to determine whether a finite linear term rewriting system  $(\mathcal{R}, \mathcal{F})$  is  $\mathsf{BU}(k)$  (resp.  $\mathsf{BU}^-(k)$ ) or not, is undecidable.

*Proof.* For every finite semi-Thue system  $\mathcal{R}$  the corresponding term rewriting system  $\hat{\mathcal{R}}$  (defined in §2.5) is finite and linear. Moreover, by point 2 of definition 3.19,  $\mathcal{R}$  is  $\mathsf{BU}(k)$  iff  $\hat{\mathcal{R}}$  is  $\mathsf{BU}(k)$ . Hence this theorem is a straightforward corollary of Theorem 5.11.

### 6. Strongly Bottom-up systems

Since the BU(k) conditions are, as such, undecidable (Theorem 5.12), we are lead to define some stronger but *decidable* conditions. We study in §6.1 the *strongly bottom-up* (SBU for short) restriction. We introduce in §6.2 a technical tool that will be used in §6.3 and §6.4 for giving a polynomially decidable condition implying condition SBU.

#### 6.1. Strongly bottom-up systems

We abbreviate strongly bottom-up to sbu.

**Definition 6.1.** A system  $(\mathcal{R}, \mathcal{F})$  is said  $\mathsf{SBU}(k)$  iff for every derivation  $D: s \to_{\mathcal{R}}^* t$ , from a term  $s \in \mathcal{T}(\mathcal{F})$  to a term  $t \in \mathcal{T}(\mathcal{F})$ ,

$$D$$
 is wbu  $\Leftrightarrow D$  is bu( $k$ ).

We denote by SBU(k) the class of SBU(k) systems and by  $SBU = \bigcup_{k \in \mathbb{N}} SBU(k)$  the class of strongly bottom-up systems.

In other words: instead of requiring that the binary relations  $\to_{\mathcal{R}}^*$  and  $_k \to_{\mathcal{R}}^*$  over  $\mathcal{T}(\mathcal{F})$  are equal, we require that *all* wbu marked derivations starting on an unmarked term use only marks smaller or equal to k. The following lemma is obvious.

**Lemma 6.2.** Every SBU(k) system is BU(k).

This stronger condition over term rewriting systems is interesting because of the following property.

**Proposition 6.3.** For every  $k \geq 0$ , it is decidable whether a finite term rewriting system  $(\mathcal{R}, \mathcal{F})$  is SBU(k).

*Proof.* Note that every marked derivation starting from some  $s \in \mathcal{T}(\mathcal{F})$  and leading to some  $\overline{t} \in \mathcal{T}(\mathcal{F}^{\mathbb{N}}) \setminus \mathcal{T}(\mathcal{F}^{\leq k})$  must decompose as

$$s \xrightarrow[k+1]{} \xrightarrow{*} \overline{s}' \xrightarrow{*} \overline{t},$$

with  $\overline{s}' \in \mathcal{T}(\mathcal{F}^{\leq k+1}) \setminus \mathcal{T}(\mathcal{F}^{\leq k})$ . A necessary and sufficient condition for  $\mathcal{R}$  to be  $\mathsf{SBU}(k)$  is thus that:

$$(_{k+1} \hookrightarrow_{\mathcal{R}}^{*}) [\mathcal{T}(\mathcal{F}^{\leq k+1}) \setminus \mathcal{T}(\mathcal{F}^{\leq k})]) \cap \mathcal{T}(\mathcal{F}) = \emptyset.$$
 (92)

By Theorem 4.2 the left-handside of equality (92) is a recognizable set for which we can construct a f.t.a; we then just have to test whether this f.t.a recognizes the empty set or not.

According to the results of [23] it seems likely that the property  $[\exists k \geq 0$  such that  $(\mathcal{R}, \mathcal{F})$  is  $\mathsf{SBU}(k)$  ] is undecidable for term rewriting systems. It is then interesting to look for a decidable sufficient condition. Our condition is based on a finite graph that we define in next subsection.

#### 6.2. The sticking-out graph $SG(\mathcal{R})$

Let us associate with every Term Rewriting System a graph whose vertices are the rules of the system and whose arcs (R, R') express some kind of overlap between the right handside of R and the left handside of R'. Every arc has a label indicating the category of overlap that occurs and a weight which is an integer (0 or 1). The intuitive meaning of the weight is that any derivation step using the corresponding overlap would increase some mark by this weight. The precise graph is defined below and is directly inspired by the one of [35], though slightly different.

**Definition 6.4.** Let  $s \in \mathcal{T}(\mathcal{F}, \mathcal{V})$ ,  $t \in \mathcal{T}(\mathcal{F}, \mathcal{V}) \setminus \mathcal{V}$  and  $w \in \mathcal{P}os_{\mathcal{V}}(t)$ . We say that s sticks out of t at w if

1. 
$$\forall v \in \mathcal{P}os(t) \ s.t. \ \varepsilon \leq v \prec w, \ v \in \mathcal{P}os(s) \ and \ s(v) = t(v).$$

2.  $w \in \mathcal{P}os(s)$  and  $s/w \notin \mathcal{T}(\mathcal{F})$ .

If in addition  $s/w \notin \mathcal{V}$  then s strictly sticks out of t at w.

**Definition 6.5.** Let  $\mathcal{R} = \{l_1 \to r_1, \dots, l_n \to r_n\}$  be a system. The stickingout graph is the directed graph  $SG(\mathcal{R}) = (V, E)$  where  $V = \{1, \dots, n\}$  and E is defined as follows:

- a) if  $l_j$  strictly sticks out of a subterm of  $r_i$  at w,  $i \stackrel{(a)}{\rightarrow} j \in E$ ;
- b) if a strict subterm of  $l_j$  strictly sticks out of  $r_i$  at w,  $i \stackrel{(b)}{\rightarrow} j \in E$ ;
- c) if a subterm of  $r_i$  sticks out of  $l_j$  at  $w, i \stackrel{(c)}{\rightarrow} j \in E$ ;
- d) if  $r_i$  sticks out of a strict subterm of  $l_j$  at w,  $i \stackrel{(d)}{\rightarrow} j \in E$ .

Figure 19 shows all the possibilities in the four categories (a), (b), (c), (d).

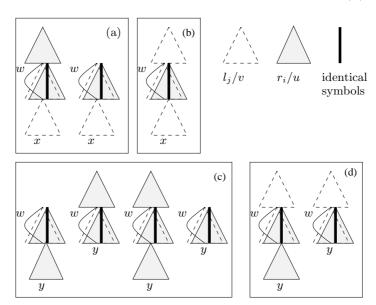

Figure 19: Sticking-out cases

**Example 6.6.** The graph of the system  $\mathcal{R}_0 = \{f(f(x)) \to f(x)\}$  contains one vertex and two loops labeled (d) and (a).

It can be shown with an ad hoc proof that  $\mathcal{R}_0 \in \mathsf{BU}$  (actually in  $\mathsf{BU}^-(1)$ ). We have already seen in Example 3.18 that  $\mathcal{R}_0 \not\in \mathsf{SBU}$ .

**Example 6.7.** The graph of system  $\mathcal{R}_4 = \{g(f(g(x))) \rightarrow f(x)\}$  contains one vertex and a simple loop labeled (b).  $\mathcal{R}_4$  is not inverse recognizability preserving:

$$(\rightarrow_{\mathcal{R}_4}^*)[\{f(a)\}] = \{g^n(f(g^n(a))) \mid n \ge 0\},\$$

which is not recognizable.

The weight of each arc of  $SG(\mathcal{R})$  is defined by:

- arcs(a) or (b) have weight 1,
- arcs(c) or (d) have weight 0.

The weight of a path in the graph is the sum of the weights of its arcs. The weight of a graph is the maximal weight of a path in the graph; it is infinite if the graph contains a cycle with an arc of weight 1.

The sticking-out of  $\mathcal{R}_1$  of Example 3.1 is given in Figure 20.

$$\begin{array}{c} 1:\mathsf{f}(x)\to\mathsf{g}(x)\\ 2:\mathsf{g}(\mathsf{h}(x))\to\mathsf{i}(x)\\ 3:\mathsf{i}(x)\to\mathsf{a} \end{array} \tag{1}$$

Figure 20: The sticking-out graph of  $\mathcal{R}_1$ 

### 6.3. A sufficient condition for semi-Thue systems

Let us fix a semi-Thue system  $\mathcal{R}$  over an alphabet Y. The main result of this subsection is that, if every path of  $\mathsf{SG}(\mathcal{R})$  has a weight  $\leq k$ , then  $\mathcal{R}$  has the property  $\mathsf{SBU}(k+1)$ . We prove some lemmas establishing some links between wbu derivations, on one hand, and paths of  $\mathsf{SG}(\mathcal{R})$ , on the other hand. Again, we use the notation defined in §5.1 for manipulating derivations.

Figure 21: Downwards derivation

# Lemma 6.8. (Downwards derivations)

Let  $R, R' \in \mathcal{R}, u, v, u' \in Y^*$  and D a derivation such that  $uRv \otimes D \otimes u'R'$  is a wbu-derivation. Then, there exists a path from R to R' in  $SG(\mathcal{R})$ . (See figure 21).

*Proof.* Let us consider the following property P(n):

for every wbu-derivation  $(u_i R_i v_i)_{0 \le i \le n+1}$  for the system  $\mathcal{R}$ , if  $|v_{n+1}| = 0$  then there exists a path from  $R_0$  to  $R_{n+1}$  in  $SG(\mathcal{R})$ .

We show by induction over n that, for every  $n \in \mathbb{N}$ , P(n) holds.

Basis: n = 0.

We thus have  $|v_0| + |\partial^+(R_0)| + |u_0| = |\partial^-(R_1)| + |u_1|$ . Since this derivation is wbu we also have  $|v_0| < |\partial^-(R_1)|$  or  $|v_0| = |\partial^-(R_1)| = 0$ . From these inequalities it follows that  $(R_0, R_1)$  is an edge of  $SG(\mathcal{R})$ .

Induction step:  $n \ge 1$ 

We define

$$i := \min\{j \in [1, n+1] \mid |v_j| < |v_0| + |\partial^+(R_0)|\}.$$

Since the given derivation is wbu,  $|v_0| < |v_i| + |\partial^-(R_i)|$  or  $(|v_0| = |v_i|)$  and  $|\partial^-(R_i)| = 0$ . Hence  $(R_0, R_i)$  is an edge of  $SG(\mathcal{R})$  and  $(u_j R_j v_j)_{1 \le j \le n+1}$  is a wbu-derivation fulfilling  $|v_{n+1}| = 0$ . By induction hypothesis, there exists a path p from  $R_i$  to  $R_{n+1}$  in  $SG(\mathcal{R})$ . The edge  $(R_0, R_i)$  followed by the path p is a path from  $R_0$  to  $R_{n+1}$  in  $SG(\mathcal{R})$ .

Let R, R', u, v, u', D fulfill the hypothesis of the lemma. Let us note:

$$u_0 := u$$
,  $R_0 := R$ ,  $v_0 := v$ ,  $D := (u_i R_i v_i)_{1 \le i \le n}$ ,  $u_{n+1} := u'$ ,  $R_{n+1} := R'$ ,  $v_{n+1} := \varepsilon$ .

Applying P(n) to the derivation  $(u_i R_i v_i)_{0 \le i \le n+1}$ , we obtain the conclusion of the lemma.

## Lemma 6.9. (Strict Downwards derivations)

Let  $R, R' \in \mathcal{R}, u, v, u' \in Y^*$  and D a derivation such that  $uRv \otimes D \otimes u'R'$  is a wbu-derivation and  $|v| \geq 1$ . Then, there exists a path with non-null weight from R to R' in  $SG(\mathcal{R})$ .

*Proof.* Let us consider the following property Q(n):

for every wbu-derivation  $(u_i R_i v_i)_{0 \le i \le n+1}$  for the system  $\mathcal{R}$ , if  $|v_0| \ge 1$  and  $|v_{n+1}| = 0$ , then there exists a path with non-null weight from  $R_0$  to  $R_{n+1}$  in  $\mathsf{SG}(\mathcal{R})$ .

We show by induction over n that, for every  $n \in \mathbb{N}$ , Q(n) holds.

Basis: n = 0.

Q(0): we thus have  $|v_0| + |\partial^+(R_0)| + |u_0| = |\partial^-(R_1)| + |u_1|$ . Since this derivation is wbu we also have  $|v_0| < |\partial^-(R_1)|$ . From these inequalities it follows that  $(R_0, R_1)$  is an edge of type (a) or (b) of  $SG(\mathcal{R})$ .

Induction step:  $n \ge 1$ .

We define

$$i := \min\{j \in [1, n+1] \mid |v_j| < |v_0| + |\partial^+(R_0)|\}.$$

case 1:  $|v_i| \ge |v_0|$ .

In this case  $(R_0, R_i)$  is an edge of  $SG(\mathcal{R})$  and  $(u_j R_j v_j)_{i \leq j \leq n+1}$  is a wbuderivation fulfilling  $|v_i| \geq 1$  and  $|v_{n+1}| = 0$ . Hence, by induction hypothesis, there exists a path p from  $R_i$  to  $R_{n+1}$ , with non-null weight, in  $SG(\mathcal{R})$ . The edge  $(R_0, R_i)$  followed by the path p is a path with non-null weight from  $R_0$ to  $R_{n+1}$ .

case 2:  $|v_i| < |v_0|$ .

In this case, since the given derivation is wbu,  $|v_0| < |v_i| + |\partial^-(R_i)|$ . Hence  $(R_0, R_i)$  is an edge of weight 1 of  $SG(\mathcal{R})$ . By lemma 6.8 there exists a path p from  $R_i$  to  $R_{n+1}$  in  $SG(\mathcal{R})$ . We can conclude as in case 1.

From Q(n) we can deduce the lemma.

### Lemma 6.10. (History of a mark)

Let D be some marked wbu-derivation and let  $y \in Y, w_1, w_2 \in Y^*$  such that  $\partial^-(D)$  is unmarked,  $\partial^+(D) = w_1 y w_2$  and the mark of y in the corresponding marked word is k > 0. Then, there exist  $u, v \in Y^*, R \in \mathcal{R}$  and some derivations D', D'' such that

- 1-  $D = D' \otimes uRvyw_2 \otimes D''yw_2$
- 2- the mark of y in every step of  $D''yw_2$  is k
- 3- the mark of y in  $\partial^+(D')$  is < k. (See figure 22)

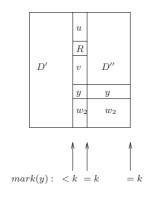

Figure 22: History of a mark

*Proof.* Let us remark that every derivation D fulfilling the hypothesis of the lemma must have a length  $\ell(D) = n + 1$  for some integer  $n \geq 0$  (since its result  $\partial^+(D)$  has some non-null mark). We prove the lemma by induction on this integer n.

Basis: n = 0.

Thus  $D = v_1 R v_2$  for some  $v_1, v_2 \in Y^*, R \in \mathcal{R}$ . Since the given occurrence of y has a non-null mark, it must be a position of  $v_2$ . It follows that  $D = u R v y w_2$  for some words  $u, v \in Y^*$ . Let us define:

$$D' := D_{u\partial^-(R)vyw_2}, \ D'' := D_{w_1}.$$

These derivations fulfill conclusions (1-3) of the lemma.

Induction step:  $n \ge 1$ .

By the same arguments,  $D = E \otimes uRvyw_2$  for some  $u, v \in Y^*, R \in \mathcal{R}$  and some derivation E of length n.

Case 1: The mark of y in  $\partial^+(E) = u\partial^-(R)vyw_2$  is k.

By induction hypothesis E has some decomposition as  $E = E' \otimes u' R' v' y w_2 \otimes E'' y w_2$  such that the mark of y in every step of  $E'' y w_2$  is k

and the mark of y in  $\partial^+(E')$  is < k. Taking D' := E' and  $D'' := E'' \otimes uRv$ , the conclusion of the lemma is fulfilled.

Case 2: The mark of y in  $\partial^+(E) = u\partial^-(R)vyw_2$  is < k.

Taking D' := E and  $D'' := D_{u\partial^+(R)v}$ , the conclusion of the lemma is fulfilled.

Let  $\mathcal{R}$  be a semi-Thue system and  $k \in \mathbb{N}$ . We consider the following property  $\mathsf{PATH}(k)$ : for every  $v_1, w_2 \in Y^*, R' \in \mathcal{R}$  and wbu-derivations D, E such that

$$E = D \otimes v_1 R' w_2 \quad \& \quad \mathsf{m}(\mathsf{last}(v_1 \partial^-(R'))) = k \tag{93}$$

there exists a path in  $SG(\mathcal{R})$  with weight  $\geq k$  and with extremity R'.

**Lemma 6.11.** Let  $\mathcal{R}$  be a semi-Thue system. For every  $k \in \mathbb{N}$ , the property PATH(k) holds.

*Proof.* We prove by induction over  $k \in \mathbb{N}$  the statement

$$\forall k \in \mathbb{N}, \mathsf{PATH}(k).$$

Basis: k = 0

There exists a path of length 0, thus of weight  $\geq 0$ , in  $SG(\mathcal{R})$ , with extremity R'.

Induction step:  $k \ge 1$ 

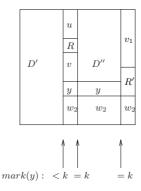

Figure 23: From marks (in derivations) to weights (in paths)

Let us assume (93). Applying lemma 6.10 to the derivation D, to the letter  $y = \mathsf{last}(v_1 \partial^-(R'))$  and to the words  $w_1 := v_1 \partial^-(R') y^{-1}$ ,  $w_2$ , we obtain u, v, R, D', D'' such that:

$$E = D' \otimes uRvyw_2 \otimes D''yw_2 \otimes v_1R'w_2,$$

the mark of y in every step of  $D''yw_2$  is k and the mark of y in  $\partial^+(D')$  is < k (see figure 23). By the definition of a marked rewriting-step, we must have:

$$k = M(\overline{u}\overline{l}, x)$$

where  $R = l \to r$ , x is the variable of l and  $\overline{u}$  is the marked word corresponding to the context where R is applied. Let us consider  $E' := D' \otimes uRvyw_2$ . It fulfills

$$E' = D' \otimes uRvyw_2 \& \operatorname{m}(\operatorname{last}(v\partial^-(R))) = k - 1$$

By induction hypothesis, there exists a path p in  $SG(\mathcal{R})$  with weight  $\geq k-1$  and with extremity R; by lemma 6.9, there exists a path q with non-null weight from R to R' in  $SG(\mathcal{R})$ . The concatenation  $p \cdot q$  is a path with weight  $\geq k$  in  $SG(\mathcal{R})$ .

**Proposition 6.12.** Let  $\mathcal{R}$  be a semi-Thue system and  $k \geq 1$ . If  $W(SG(\mathcal{R})) = k - 1$  then  $\mathcal{R} \in SBU(k)$ .

*Proof.* Suppose that  $\mathcal{R} \notin \mathsf{SBU}(k)$ . This means that some wbu-derivation (w.r.t.  $\hat{\mathcal{R}}$ ) starting from a non-marked (unary) term over  $Y \cup \{\#\}$  reaches a marked term with the mark k+1. Let  $\hat{E}$  be a wbu derivation (w.r.t.  $\hat{\mathcal{R}}$ ) with minimal length reaching the mark k+1.Let us consider the derivation

E (w.r.t.  $\mathcal{R}$ ) corresponding to  $\hat{E}$  (it is obtained from  $\hat{E}$  just by erasing all occurrences of the nullary symbol #). This derivation E must have a decomposition of the form (93). By lemma 6.11 PATH(k) holds, hence there exists a path in  $SG(\mathcal{R})$  with weight  $\geq k$ . By contraposition, if  $W(SG(\mathcal{R})) \leq k-1$  then  $\mathcal{R} \in SBU(k)$ , which proves the proposition.

6.4. A sufficient condition for term rewriting systems

**Proposition 6.13.** Let  $\mathcal{R}$  be a linear system and  $k \geq 1$ . If  $W(SG(\mathcal{R})) = k-1$  then  $\mathcal{R} \in SBU(k)$ .

*Proof.* (Sketch) Let us associate to  $\mathcal{R}$  the semi-Thue system T corresponding to the "branch-rewriting" induced by  $\mathcal{R}$ : it consists of all the rules

$$u \to v \in \mathcal{F}^* \times \mathcal{F}^*$$

such that there exists a rule  $l \to r \in \mathcal{R}$ , and a variable  $x \in \mathcal{V}$ , such that ux labels a branch of l and vx labels a branch of r. Suppose that the mark k+1 appears in a  $\mathcal{R}$ -derivation. Since the marking-mechanism is defined branch by branch, the mark k+1 also appears in a T-derivation. By Proposition 6.12, there exists a path in  $\mathsf{SG}(T)$  with weight  $\geq k$ . Let us fix some total ordering on  $\mathcal{R}$  and define the map  $h: T \to \mathcal{R}$  by:

$$h(u \to v) = l \to r$$

iff  $l \to r$  is the smallest rule of  $\mathcal{R}$  such that ux (resp. vx) labels a branch of l (resp. r) and x is a variable. This map h is an homomorphism of labelled graphs from  $\mathsf{SG}(T)$  to  $\mathsf{SG}(\mathcal{R})$ , i.e. it is compatible with the labels. It follows that it is also compatible with the weights. Hence there exists a path of weight  $\geq k$  in  $\mathsf{SG}(\mathcal{R})$ .

Corollary 6.14. Let  $\mathcal{R}$  be a linear system. If  $W(SG(\mathcal{R}))$  is finite then  $\mathcal{R} \in SBU$ .

Proposition 6.15. LFPO<sup>-1</sup>  $\subseteq$  SBU.

*Proof.* Let  $\mathcal{R} \in \mathsf{LFPO}^{-1}$ . By definition the sticking-out graph of [35] does not contain a cycle of weight 1, hence from corollary 6.14,  $\mathcal{R} \in \mathsf{SBU}$ . So  $\mathsf{LFPO}^{-1} \subseteq \mathsf{SBU}$ .  $\mathcal{R}_0 \in \mathsf{SBU}$  but  $\mathcal{R}_0 \notin \mathsf{LFPO}^{-1}$ . We conclude that  $\mathsf{LFPO}^{-1} \subseteq \mathsf{SBU}$ .

**Example 6.16.** Let  $\mathcal{R}_5 = \{f(g(x), a) \to f(x, b)\}$ .  $\mathcal{R}_5 \not\in \mathsf{LFPO}^{-1}$  as  $\mathsf{SG}(\mathcal{R})$  contains a loop (a) so a loop of weight 1. It is easy to show by an ad-hoc proof that  $\mathcal{R}_5 \in \mathsf{SBU}^-(1)$ . However our sufficient condition is not able to capture  $\mathcal{R}_5$ .

Corollary 6.17. LFPO<sup>-1</sup>  $\subsetneq$  SBU  $\subsetneq$  BU.

# 7. Perspectives

Here are some natural perspectives of development for this work:

- 1. the method developed here for the sake of showing a property of recognizability preservation might be used, also, for testing some termination properties; this idea is implemented in [14, 34]
- 2. it is tempting to extend the notion of *bottom-up* rewriting (resp. system) to left-linear but non right-linear systems. This class would extend the class of growing systems studied in [27]; this idea is implemented in [15].
- 3. a dual notion of *top-down* rewriting and a corresponding class of top-down systems should be defined; this class would presumably extend the class of Layered Transducing systems defined in [31].
- 4. we know that the condition BU(k) is undecidable (for every  $k \ge 1$ ) and that the condition SBU(k) is decidable (for every  $k \ge 1$ ); whether the condition SBU is decidable is thus a natural question;
- 5. the systems considered in [17] and the systems considered here might be treated in a unified manner; such a unified approach should lead to an even larger class of rewriting systems with still good algorithmic properties.

Some work in directions 1,2,3 has been undertaken by the authors.

Acknowledgements. We thank Marc Sylvestre for his constructive criticism of a previous version of §4.1, in particular for correcting the construction of subsection 4.2.1. We also thank the referees of RTA'07 and a referee of JSC for their constructive criticism.
